

# Elastic and Inelastic Electron-Phonon Scattering in Quantum Dots

*Oleg Prezhdo*  
U. Rochester

CECAM  
Nov 7-9, 2012

# Electron-Phonon Dynamics in QDs

## Elastic

Luminescence linewidths

Coherences between single and multiple excitons, etc.

Semiclassical corrections to quantum-classical simulations

## Inelastic

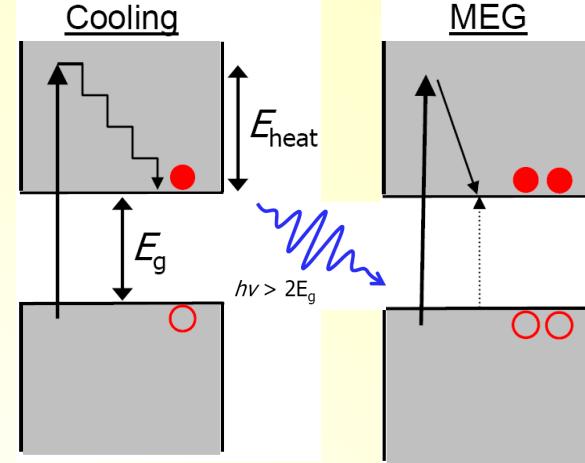

Charge cooling

Phonon-assisted Auger processes

Electron transfer from QD to  $\text{TiO}_2$

Photochemistry on QD surface  
(e.g. water splitting)

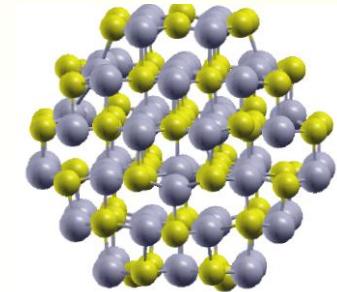

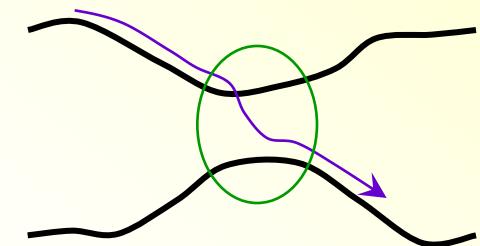

We study these processes in other nanoscale materials as well

# Outline

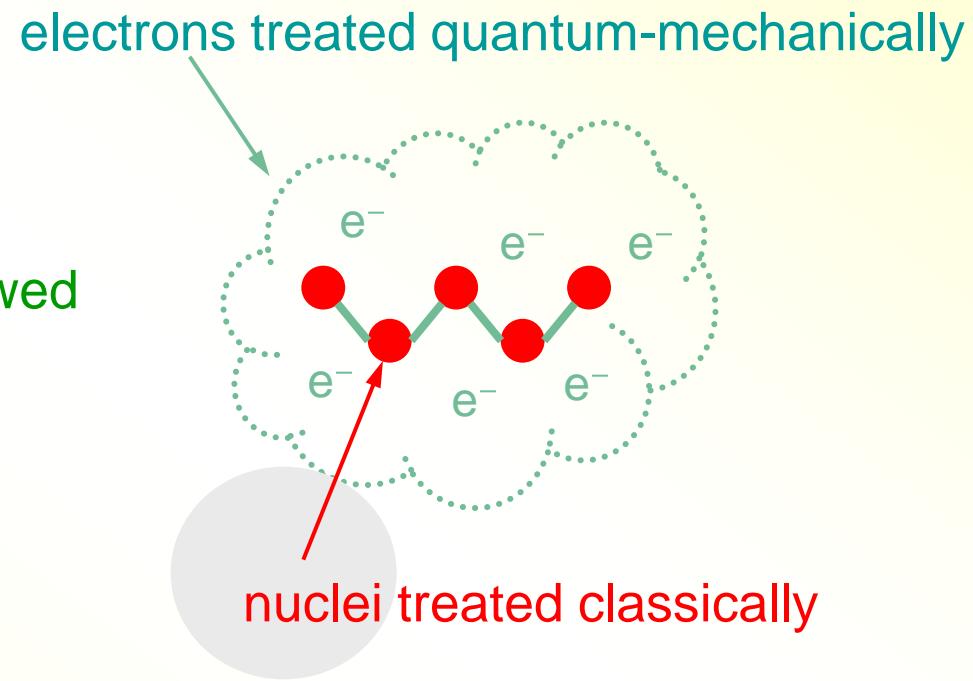

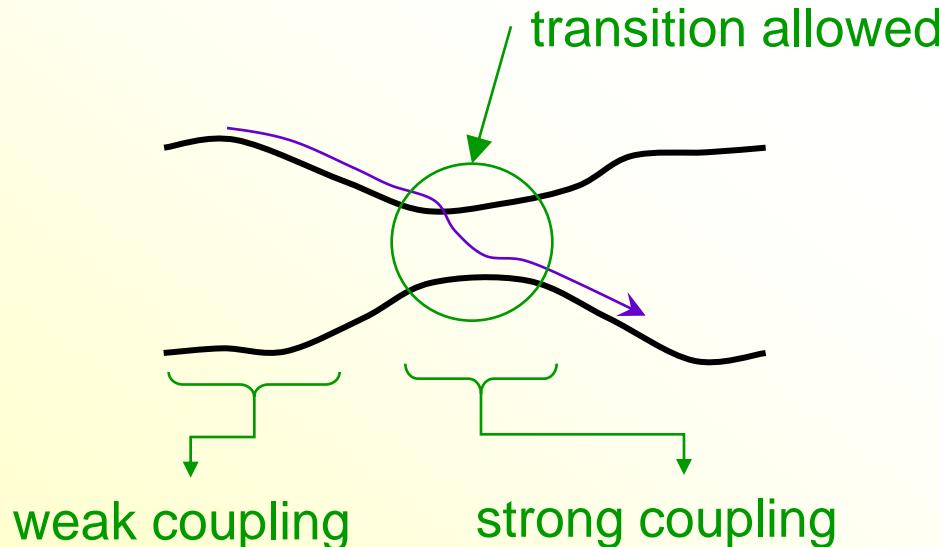

- Nonadiabatic Molecular Dynamics with TDDFT
  - Quantum-classical approximations
  - Decoherence & zero-point energy corrections
- Quantum Dots
  - Electron-Phonon Relaxation & Phonon Bottleneck
  - Multiple Exciton Generation and Recombination

# Nonadiabatic Molecular Dynamics

Nonadiabatic MD: Coupling between potential surfaces opens channels for system to change electronic states.

# Time-Domain DFT for Nonadiabatic Molecular Dynamics

Electron density derives from Kohn-Sham orbitals

$$\rho(x) = \sum_p |\varphi_p(x)|^2 \quad |\Psi\rangle = |\varphi_p(x_1, t)\varphi_q(x_2, t)\dots\varphi_v(x_N, t)\rangle_{SD}$$

DFT functional  $H$  depends on nuclear evolution  $R(t)$

Variational principle gives  $i\hbar \frac{\partial \varphi_p(x, t)}{\partial t} = H\varphi_p(x, t) \quad p = 1, 2, \dots$

Orbitals are expanded in adiabatic KS basis  $\varphi_p(x, t) = \sum c_p^\alpha(t) \chi^\alpha(x)$

$$H(x; R(t)) \chi^\alpha(x; R(t)) = \varepsilon^\alpha(R(t)) \chi^\alpha(x; R(t))$$

$$i\hbar \dot{c}^\alpha = \sum_\beta c^\beta \left( \varepsilon^\beta \delta_{\alpha\beta} - \boxed{i\hbar \langle \chi^\alpha | \vec{\nabla}_R | \chi^\beta \rangle \cdot \vec{R}} \right)$$

# Time-Domain DFT in Many-Body Kohn-Sham Basis

C. Craig, W. Duncan, O. V. Prezhdo *Phys. Rev. Lett.* **95**, 163001 (2005)

**Need to define states to hop between**

$$|\varphi_a \varphi_b \cdots \varphi_p\rangle = \sum_{j \neq k \neq \cdots \neq l}^{N_e} C_{j \dots l}(t) |\tilde{\varphi}_j \tilde{\varphi}_k \cdots \tilde{\varphi}_l\rangle$$

$$\begin{aligned} i\hbar \frac{\partial}{\partial t} C_{q \dots v}(t) = & \sum_{a \dots p}^{N_e} C_{a \dots p}(t) [E_{q \dots v} \delta_{aq} \cdots \delta_{pv} \\ & + \mathbf{D}_{a \dots p; q \dots r} \cdot \dot{\mathbf{R}}]. \end{aligned}$$

$$\mathbf{D}_{a \dots p; q \dots r} \cdot \dot{\mathbf{R}} = -i\hbar \langle \tilde{\varphi}_a \tilde{\varphi}_b \cdots \tilde{\varphi}_p | \frac{\partial}{\partial t} | \tilde{\varphi}_q \tilde{\varphi}_r \cdots \tilde{\varphi}_v \rangle$$

non-zero only if different in one orbital

# Why KS Representation Works

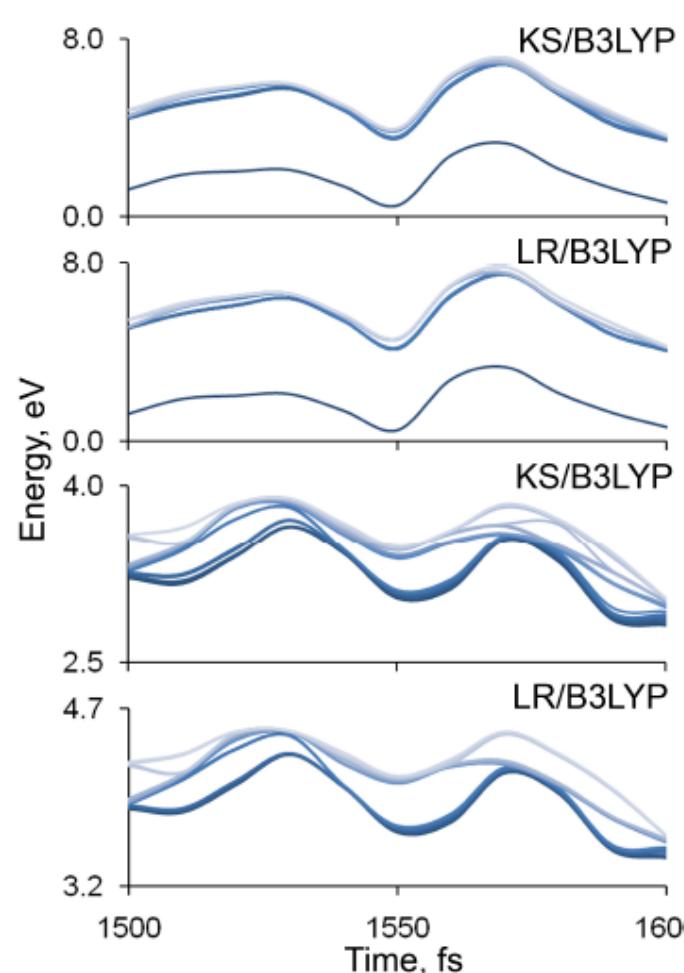

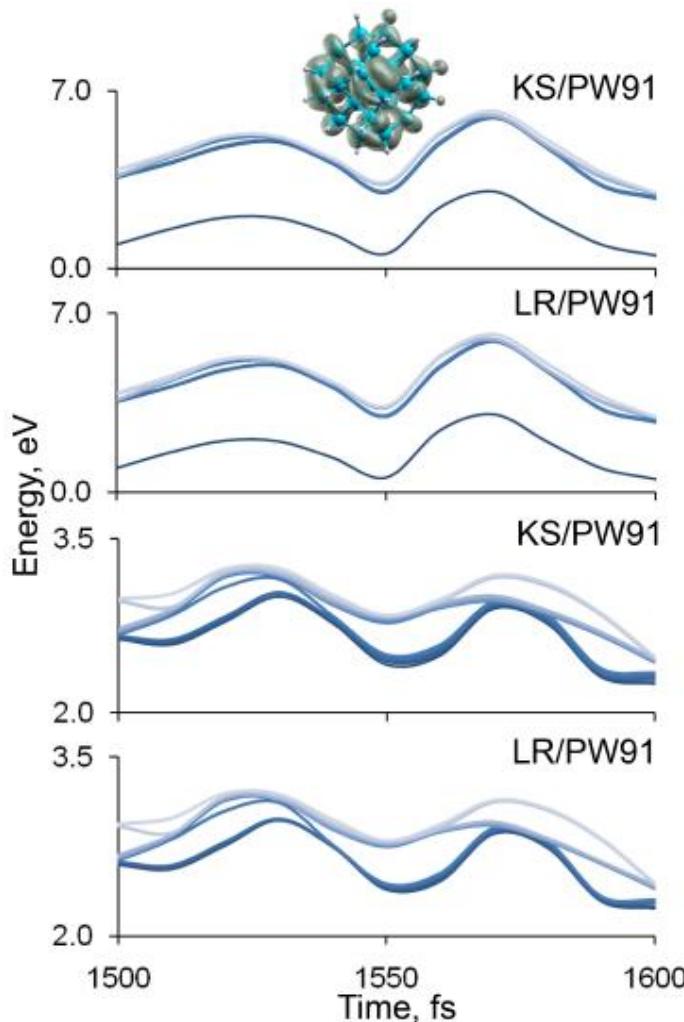

S. Fischer, B. Habenicht, A. Madrid, W. Duncan,  
O. V. Prezhdo, *J. Chem. Phys.* **134**, 024102 (2011)

1. KS excitations close to LR/TDDFT (in contrast to HF and CIS)
2. Typically, no bond-breaking, conformational changes, etc.
3. Many-electron systems, single excitation is a small perturbation
4. Averaging over many initial conditions and pathways

# Silicon Quantum Dot

S. Fischer, B. Habenicht, A. Madrid, W. Duncan,  
O. V. Prezhdo, *J. Chem. Phys.* **134**, 024102 (2011)

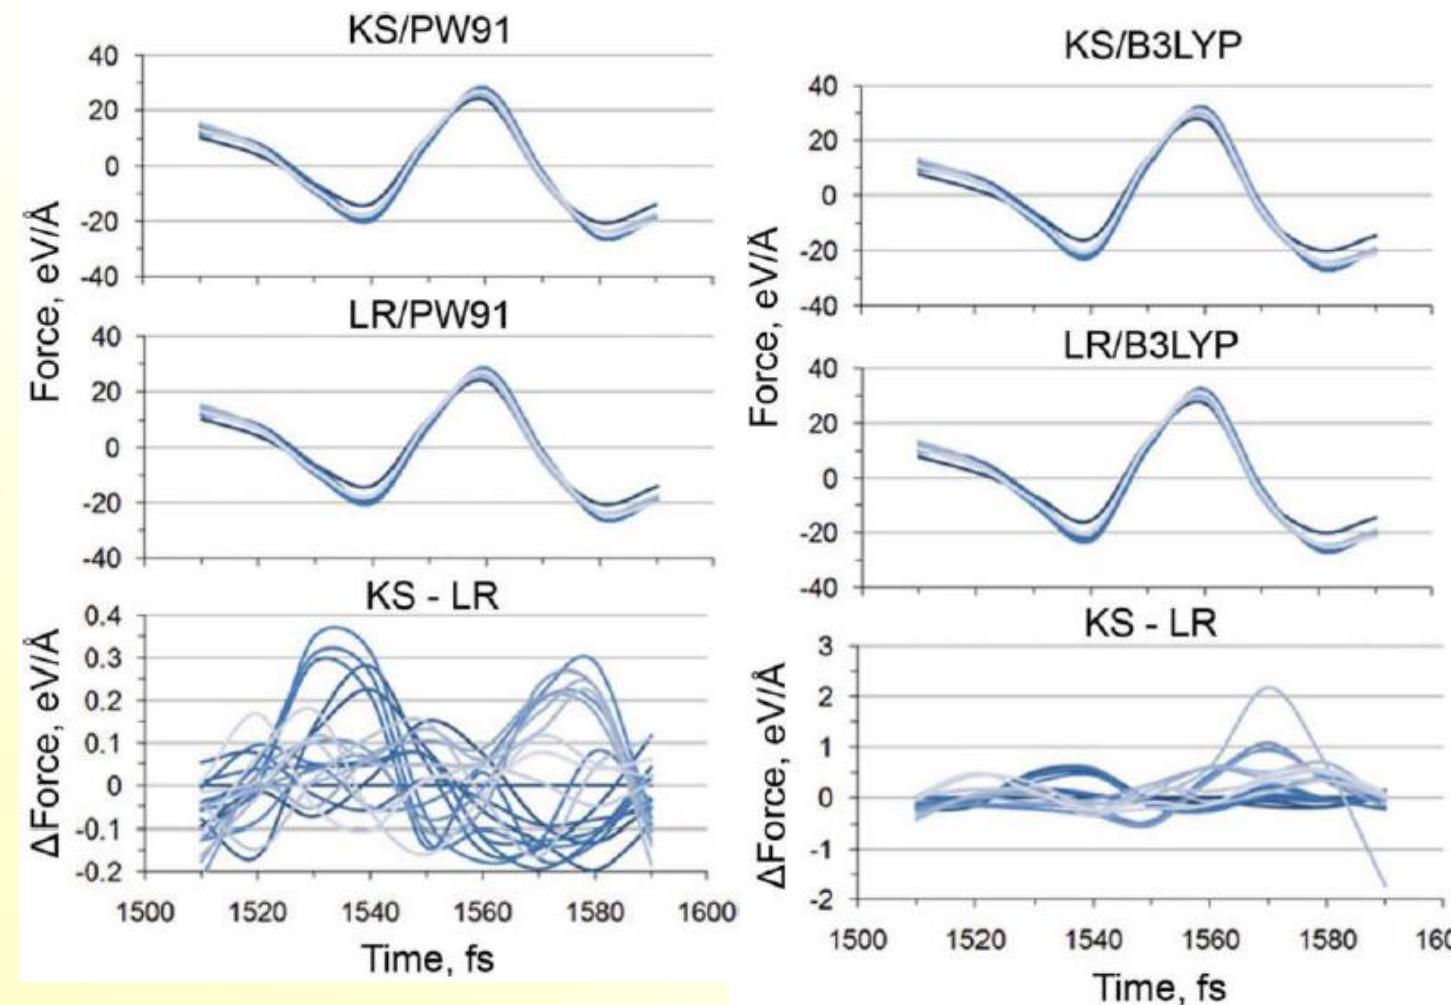

KS and LR  
agree  
better for  
PW91  
(pure DFT)  
than  
B3LYP  
(hybrid)

# Silicon Quantum Dot

S. Fischer, B. Habenicht, A. Madrid, W. Duncan,  
O. V. Prezhdo, *J. Chem. Phys.* **134**, 024102 (2011)

KS and LR  
agree  
better for

PW91  
(pure DFT)

than  
B3LYP  
(hybrid)

# Silicon Quantum Dot

S. Fischer, B. Habenicht, A. Madrid, W. Duncan,  
O. V. Prezhdo, *J. Chem. Phys.* **134**, 024102 (2011)

$$P_{i \rightarrow j} = \exp \left[ -\frac{4}{3} \frac{U_{ij}}{\hbar} \left( \frac{2U_{ij}}{d^2 U_{ij}/dt^2} \right)^{1/2} \right]$$

W. H. Miller, T. F. George,  
*J. Chem. Phys.* **56**, 5637 (1972)

$$P_{i \rightarrow j}^{tot} = 1 - \prod_n (1 - P_{n,i \rightarrow j})$$

Transition	KS/B3LYP			LR/B3LYP

# Theoretical Questions our group is interested in

- ✓ How to couple quantum and classical dynamics?  
quantum influence on classical trajectory
  
- ✓ Can one do better than classical mechanics for nuclear motion?  
zero-point motion, tunneling, branching, loss of coherence

# Quantum-Classical Lie Bracket

O. V. Prezhdo, V. V. Kisil *Phys. Rev. A* **56** 162 (1997)

O. V. Prezhdo *J. Chem. Phys.* **124** 201104 (2006)

$$[A, B]_{qc} = -\frac{i}{\hbar}[A, B] + \frac{1}{2}(\{A, B\} - \{B, A\})$$

quantum commutator + classical Poisson bracket

problems with Jacobi identity:

$$[[A, B]_{qc}, C]_{qc} + [[B, C]_{qc}, A]_{qc} + [[C, A]_{qc}, B]_{qc} = 0$$

Practical solution: derive everything quantum mechanically,  
take classical limit at the end

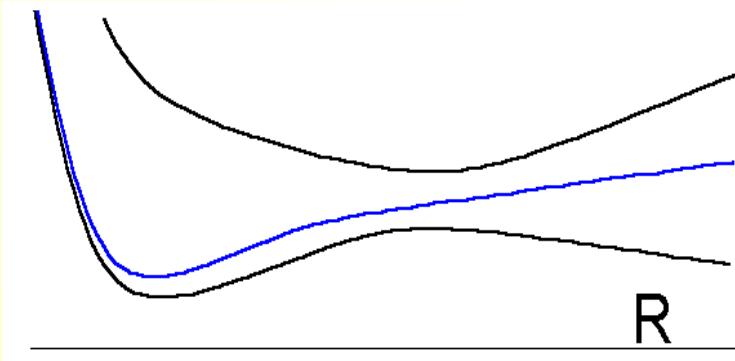

# Ehrenfest (mean-field)

Total energy of  
electrons and nuclei

$$E_{tot} = \frac{M \dot{R}^2}{2} + V(R) + Tr_x \rho(x) H(x; R)$$

is conserved     $\frac{dE_{tot}}{dt} = 0$

time-dependent Hellmann-Feynman theorem gives Newton equation

$$M \ddot{R} = -\vec{\nabla}_R V - Tr_x \rho(x) \vec{\nabla}_R H(x; R)$$

quantum force

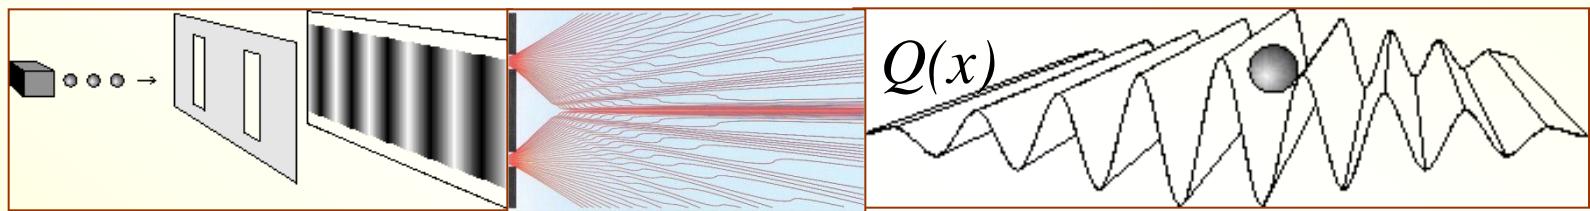

# Bohmian Quant.-Class. Mechanics

C. Brooksby, O. V. Prezhdo *Phys. Rev. Lett.* **86**, 3215 (2001); *ibid* **90**, 118902 (2003)

$\psi(x,t) = \sqrt{\rho(x,t)} e^{iS(x,t)/\hbar}$  gives Newton eq.  $m\ddot{x} = -\nabla_r [V(x) + Q(x)]$

with non-local quantum potential  $Q(x) = -\frac{\hbar^2}{2m} \frac{\nabla_x^2 \sqrt{\rho(x)}}{\sqrt{\rho(x)}}$

Quantum (x) – Classical (R)

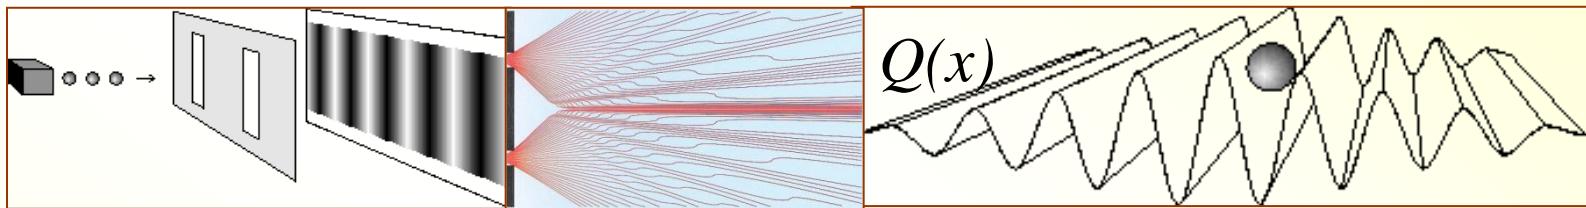

$$M\ddot{R} = -\nabla_R [V_R(R) + V_{xR}(x, R)] \quad \text{drop } Q(R)$$

$$m\ddot{x} = -\nabla_x [V_x(x) + V_{xR}(x, R) + Q(x)]$$

# Bohmian Quant.-Class. Mechanics

C. Brooksby, O. V. Prezhdo *Phys. Rev. Lett.* **86**, 3215 (2001); *ibid* **90**, 118902 (2003)

$$M\ddot{R} = -\nabla_R [V_R(R) + V_{xR}(x, R)] \quad \text{– Bohmian}$$

$$M\ddot{R} = -\nabla_R [V_R(R) + Tr_x \rho(x) V_{xR}(x, R)] \quad \text{– Ehrenfest}$$

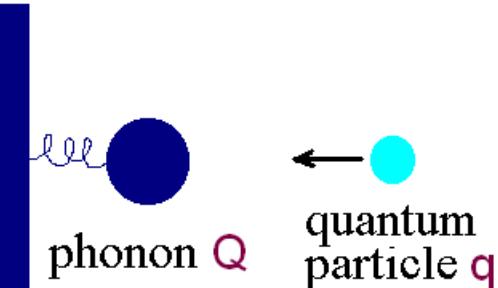

Advantage: correlation between quantum and classical particles (branching)

In practice, Bohmian trajectories are obtained from Schrodinger eq.

# Bohmian Quant.-Class.

Brooksby, Prezhdo *Phys. Rev. Lett.* **86**, 3215 (2001)

Highly simplified representation of O<sub>2</sub> interacting with Pt

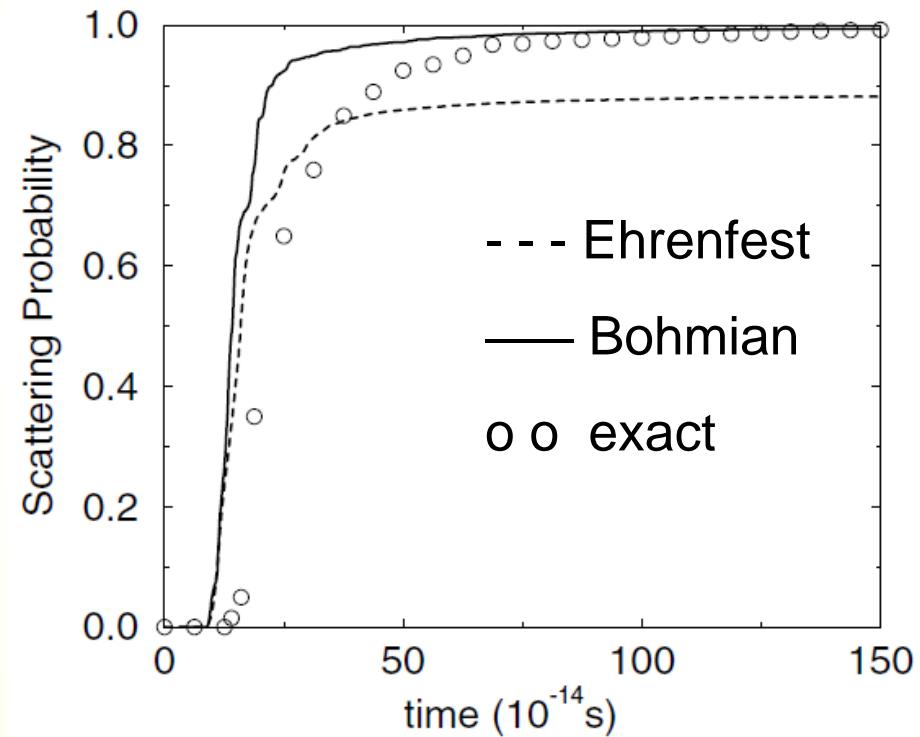

J. Strömquist, S. Gao, *J. Chem. Phys.* **106**, 5751 (1997); D.S. Sholl, J.C. Tully, *J. Chem. Phys.* **109**, 7702 (1998)

$$H(q, Q) = T_q + T_Q + V_q(q) + V_q(Q) + V_{qQ}(q, Q)$$

$$V_Q(Q) = \frac{M\Omega^2 Q^2}{2}$$

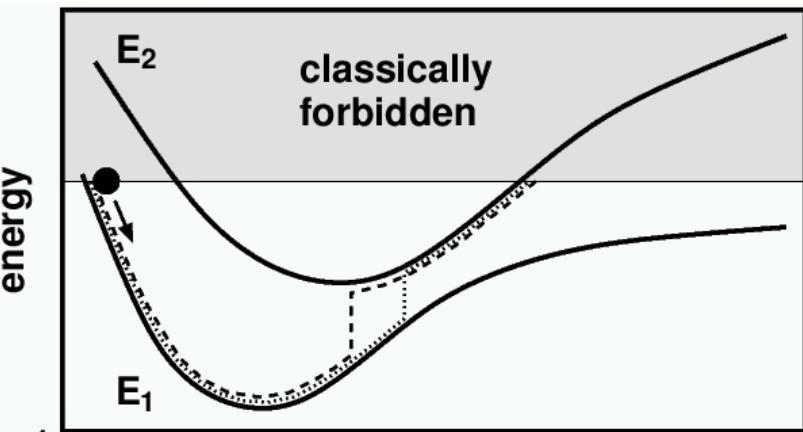

$$V_q(q) = a(e^{-2b(q-c)} - 2e^{-b(q-c)})$$

$$V_{qQ}(q, Q) = Ae^{-B(q-Q)}$$

# Surface Hopping

a.k.a., quantum-master equation  
with time-dependent transition rates:  
- non-perturbative  
- correct short time dynamics

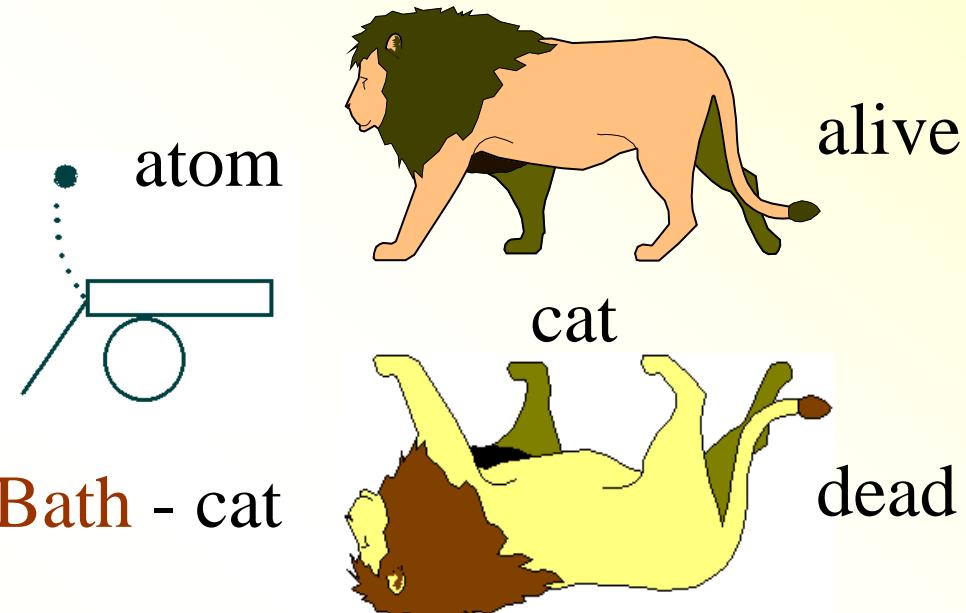

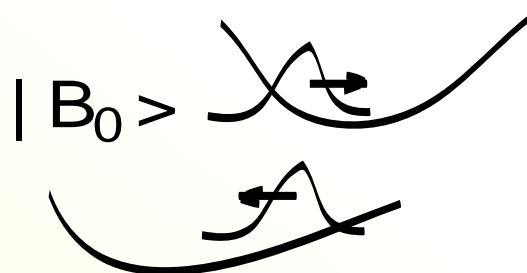

Trajectory branching:  
Tully, *JCP* **93**, 1061 (1990);

Within TDDFT:  
Craig, Duncan, Prezhdo *PRL* **95**, 163001 (2005)

Detailed balance / thermal equilibrium (due to hop rejection):  
Parahdekar, Tully *JCP* **122**, 094102 (2005)

# Schrodinger Cat and Decoherence

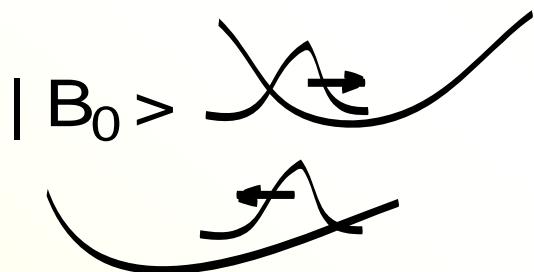

**System** - radioactive atom;    **Bath** - cat

In Nanomaterials

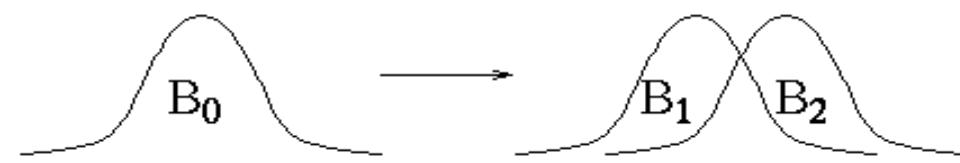

**System** - electrons, spins;    **Bath** - phonons

# Franck-Condon Factor and Decoherence

$$\sum_{\{B_2\}} \left| \langle B_1 | B_2 \rangle \right|^2 \delta(E_1 - E_2) \\ = \int e^{i(E_1 - E_2)t/\hbar} \langle B_1(t) | B_2(t) \rangle dt$$

Bath (vibrational) wave functions diverge

This affects evolution of (electronic) system

# Decoherence and Surface Hopping

O. V. Prezhdo, P. J. Rossky, *Phys. Rev. Lett.* **81**, 5294 (1998)

O. V. Prezhdo, *Phys. Rev. Lett.* **85**, 4413 (2000)

Reduced density matrix:

$$\rho = \langle B | \rho^{S-B} | B \rangle$$

$$\left\| \begin{array}{cc} \rho_{11} & \rho_{12} \\ \rho_{21} & \rho_{22} \end{array} \right\| \rightarrow \left\| \begin{array}{cc} \rho_{11} & \rho_{12} \langle B_2 | B_1 \rangle \\ \rho_{21} \langle B_1 | B_2 \rangle & \rho_{22} \end{array} \right\|$$

on decoherence  
time scale

hopping probability  $P_{12} \sim \rho_{12}$

# Decoherence and Surface Hopping

O. V. Prezhdo, P. J. Rossky, *Phys. Rev. Lett.* **81**, 5294 (1998)

O. V. Prezhdo, *Phys. Rev. Lett.* **85**, 4413 (2000)

Reduced density matrix:

$$\rho = \langle B | \rho^{S-B} | B \rangle$$

$$\begin{vmatrix} \rho_{11} & \rho_{12} \\ \rho_{21} & \rho_{22} \end{vmatrix} \rightarrow \begin{vmatrix} \rho_{11} & \rho_{12} \langle B_2 | B_1 \rangle \\ \rho_{21} \langle B_1 | B_2 \rangle & \rho_{22} \end{vmatrix}$$

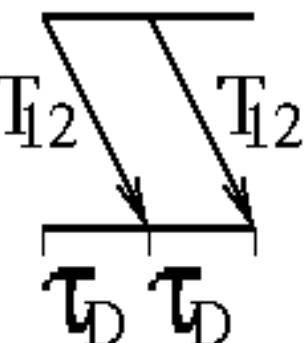

on decoherence  
time scale

hopping probability  $P_{12} \sim \rho_{12}$

## Quantum Zeno Effect

With decoherence:  $P_{12} = |T_{12}|^2 + |T_{12}|^2 + \dots$

Without decoherence  $P_{12} = |T_{12} + T_{12} + \dots|^2$

Decoherence makes transitions less likely

$$|0.1|^2 + |0.1|^2 < |0.1 + 0.1|^2$$

# Stochastic Mean-Field (SMF)

O. V. Prezhdo *J. Chem. Phys.* **111**, 8366 (1999); *Phys. Rev. Lett.* **85**, 4413 (2000)

Stochastic Schrodinger equation  
in place of regular SE in Ehrenfest

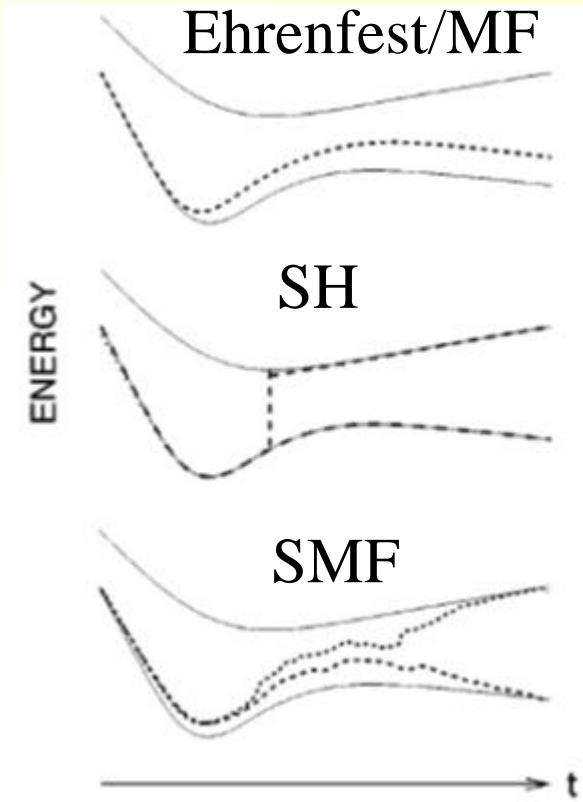

$$|d\Psi\rangle = -iH|\Psi\rangle dt - \frac{\gamma}{2} L^\dagger L |\Psi\rangle dt + \sqrt{\gamma} L |\Psi\rangle dW$$

$L$  – system-bath interaction

$\gamma$  – decoherence rate

## Advantages

1. Includes decoherence
2. Gives branching
3. Infinitesimal velocity rescaling,  
(but every time-step)

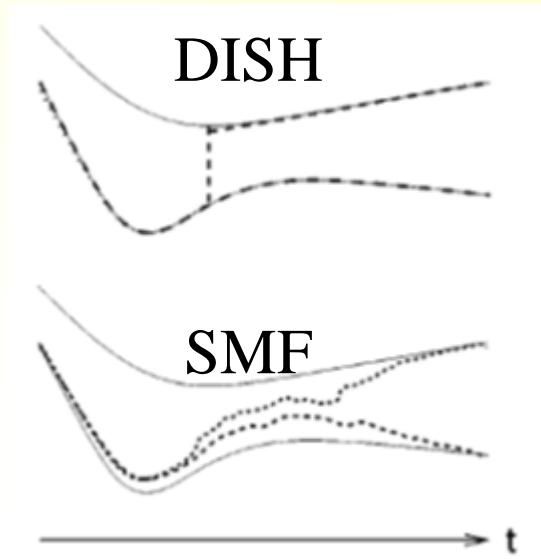

# Decoherence Induced Surface Hopping (DISH)

H. Jaeger, S. Fisher, O. V. Prezhdo *J. Chem. Phys.* **137**, 22A545 (2012)

- Evolve in an adiabatic state.
- Hop when a decoherence event occurs.
- Rescale velocity as before in SH.

## Advantages

1. Includes decoherence
2. Gives branching
3. Nuclear evolution in pure states
4. Gives detailed balance / thermal equilibrium

# Evaluating Decoherence Times

Kamisaka, Kilina, Yamashita, Prezhdo, *Nano Lett.* **6**, 2295 (2006)

## Optical response function

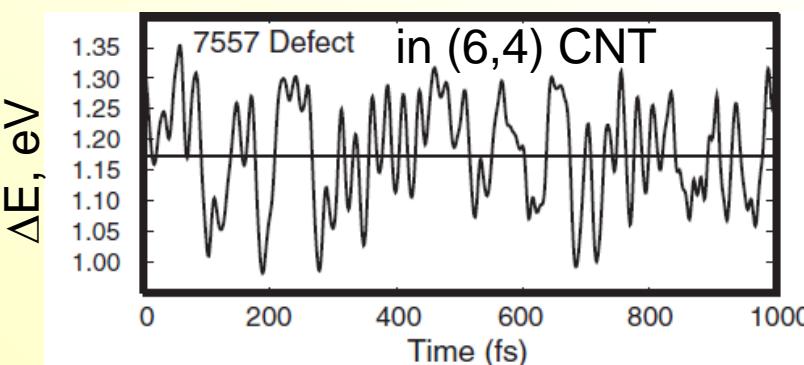

$$D(t) = \exp(i\omega t) \left\langle \exp \left[ -\frac{i}{\hbar} \int_0^t \Delta E(\tau) d\tau \right] \right\rangle_T$$

2<sup>nd</sup> order cumulant approximation

$$D(t) = \exp(-g(t))$$

$$g(t) = \int_0^t d\tau_1 \int_0^{\tau_1} d\tau_2 C(\tau_2)$$

$$C(t) = \langle \Delta E(t) \Delta E(0) \rangle_T$$

# Evaluating Decoherence Times

Kamisaka, Kilina, Yamashita, Prezhdo, *Nano Lett.* **6**, 2295 (2006)

## Optical response function

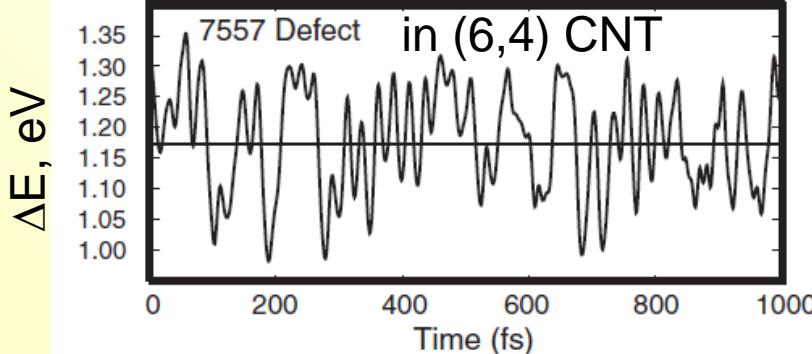

$$D(t) = \exp(i\omega t) \left\langle \exp \left[ -\frac{i}{\hbar} \int_0^t \Delta E(\tau) d\tau \right] \right\rangle_T$$

2<sup>nd</sup> order cumulant approximation

$$D(t) = \exp(-g(t))$$

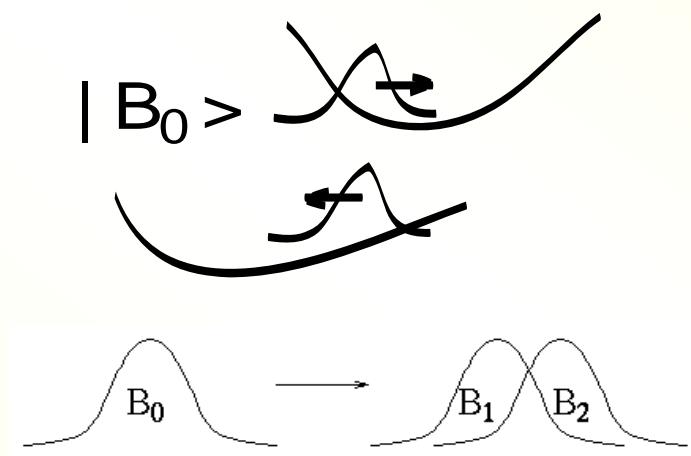

$$g(t) = \int_0^t d\tau_1 \int_0^{\tau_1} d\tau_2 C(\tau_2)$$

$$C(t) = \langle \Delta E(t) \Delta E(0) \rangle_T$$

## Gaussian approximation

$$\tau_D = \left[ \left\langle \sum_n \frac{1}{2a_n \hbar^2} (\mathbf{F}_{1n} - \mathbf{F}_{2n})^2 \right\rangle_T \right]^{-1/2}$$
$$a_n = \frac{6m k_B T}{\hbar^2} \text{ thermal de Broglie width}$$

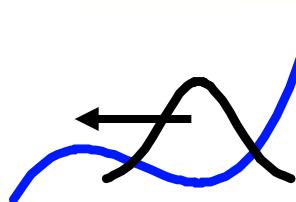

# Quantized Hamilton Dynamics

O. V. Prezhdo, Y. V. Pereverzev *J. Chem. Phys.* **113**, 6557 (2000)

O. V. Prezhdo *Theor. Chem. Acc.* **116**, 206 (2006)

$$V = \frac{q^2}{2} + \frac{q^3}{3}$$

$$\frac{d \langle q \rangle}{dt} = \langle p \rangle; \quad \frac{d \langle p \rangle}{dt} = -\langle q \rangle - \langle q^2 \rangle$$

but  $\langle q^2 \rangle \neq \langle q \rangle \langle q \rangle$  and

$$\frac{d \langle q^2 \rangle}{dt} = \langle pq + qp \rangle \equiv 2 \langle pq \rangle_s$$

$$\frac{d \langle pq \rangle_s}{dt} = \langle p^2 \rangle - \langle q^2 \rangle - \langle q^3 \rangle$$

the infinite hierarchy is terminated by a closure

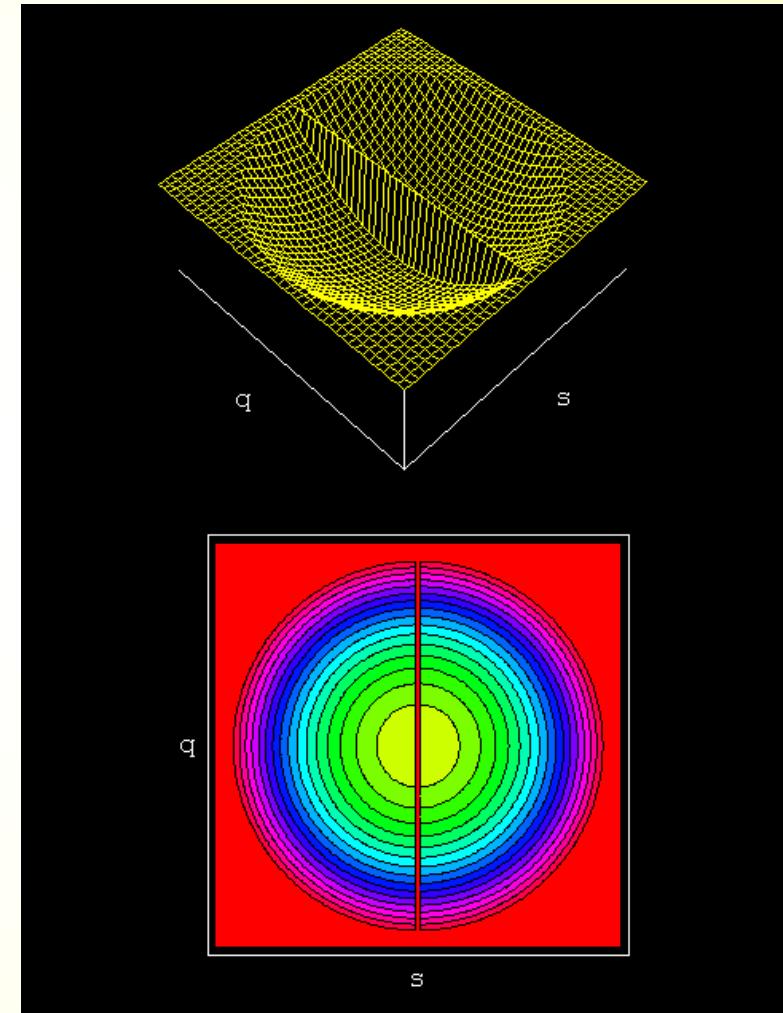

$$\langle q^3 \rangle \approx 3 \langle q^2 \rangle \langle q \rangle - 2 \langle q \rangle^3$$

# Harmonic Oscillator in Mapped QHD-2

e.g. Gdor et al.

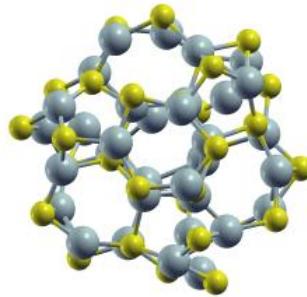

*ACS Nano* **6**, 3269 (2012)

Similar relaxation times  
for electrons and holes

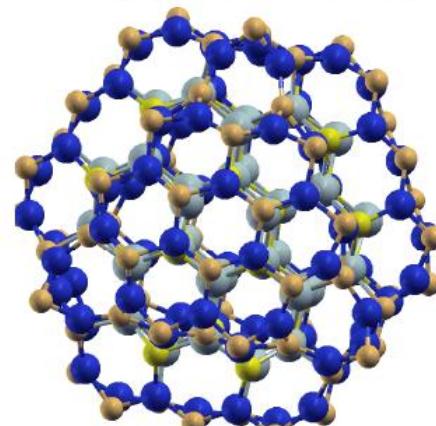

Larger dot relaxes more slowly  
due to weaker  
electron-phonon coupling

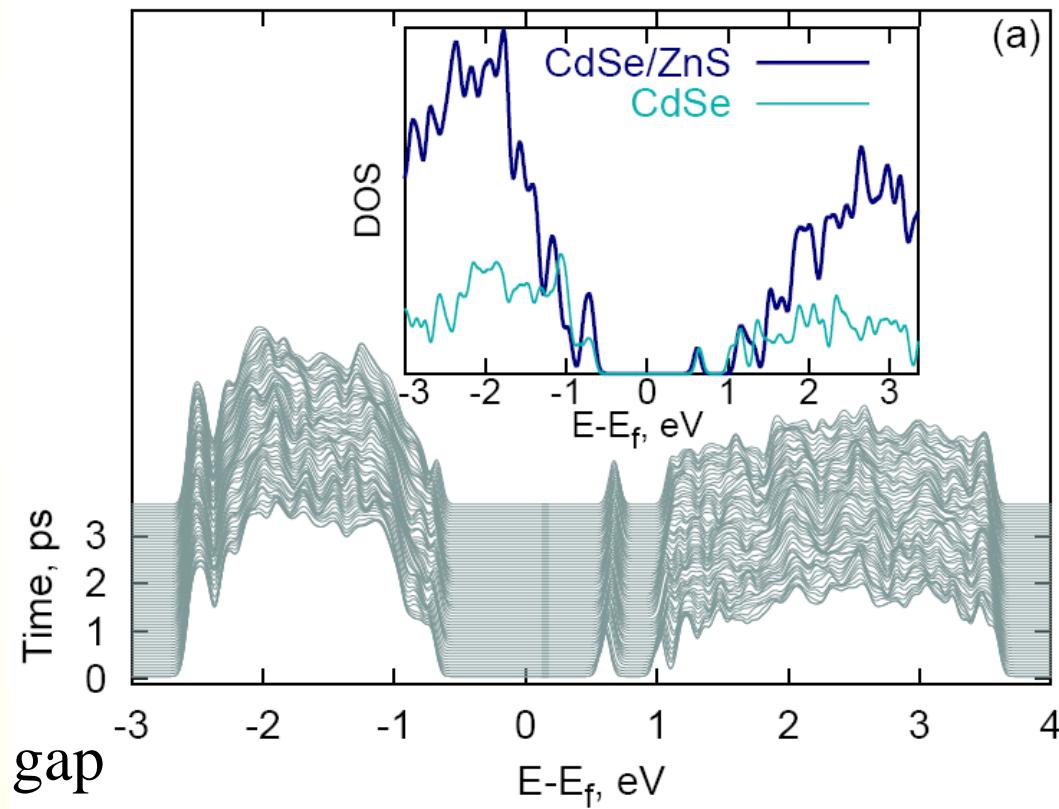

# Phonon Bottleneck for 1P Electron in CdSe Quantum Dots

$d \sim 1.2 \text{ nm}$

$d \sim 2.0 \text{ nm}$

1P–1S electron states show big gap

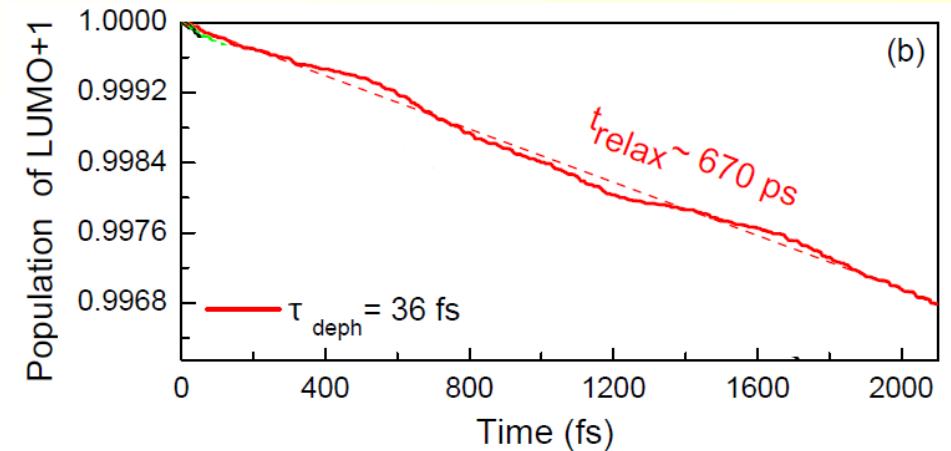

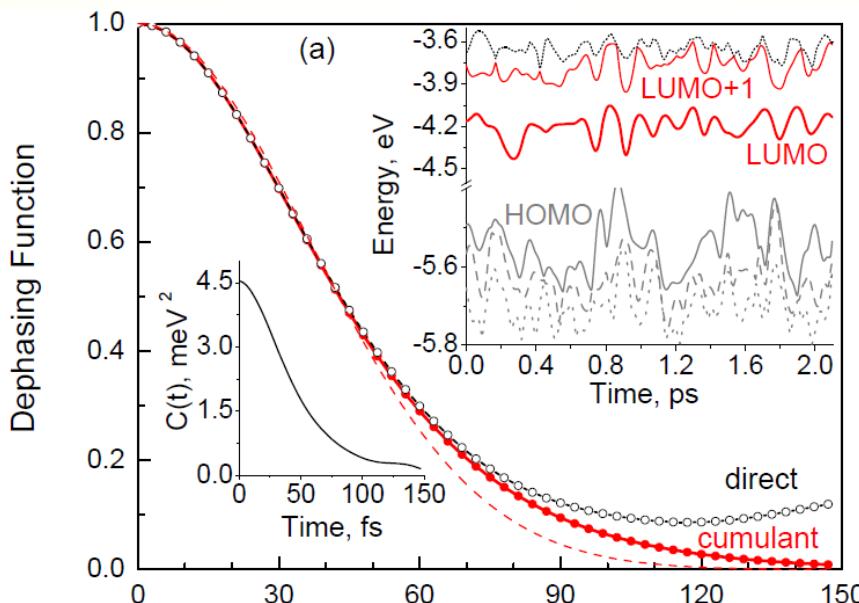

Relaxation time  $\sim 1\text{ns}$

Pandey, Guyot-Sionnest, *Science* **322** 929 (2008)

Kilina, Kilin, Prezhdo,  
*ACS Nano*, **3**, 93 (2009)

# Phonon Bottleneck for 1P Electron in CdSe Quantum Dots

Simulation shows bottleneck

Relaxation time  $\sim 1\text{ns}$

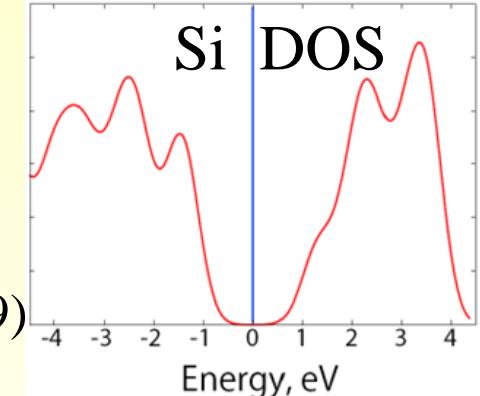

Pandey, Guyot-Sionnest, *Science* **322** 929 (2008)

Neukirch, Kilina, Kilin, Prezhdo,  
in preparation

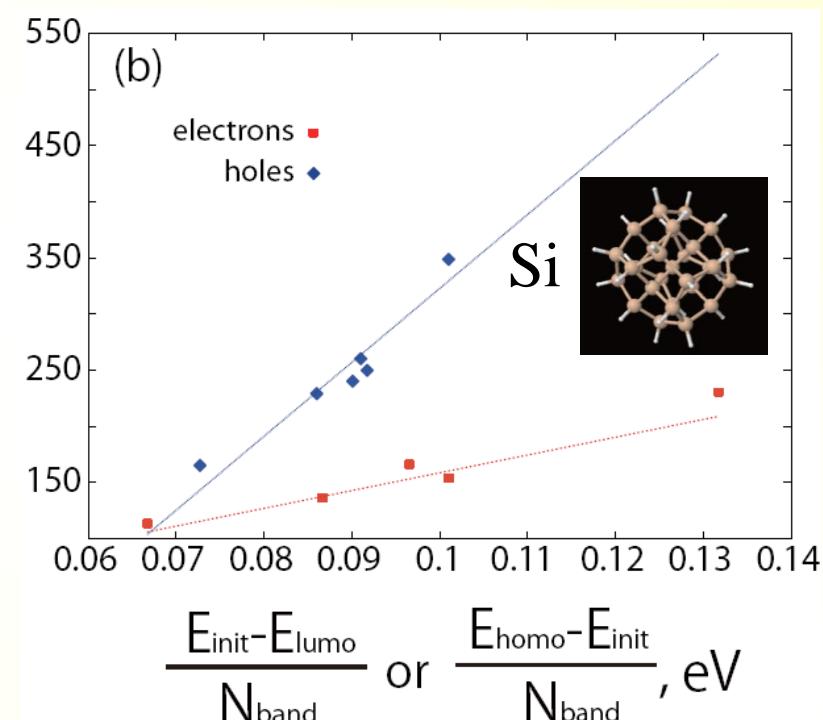

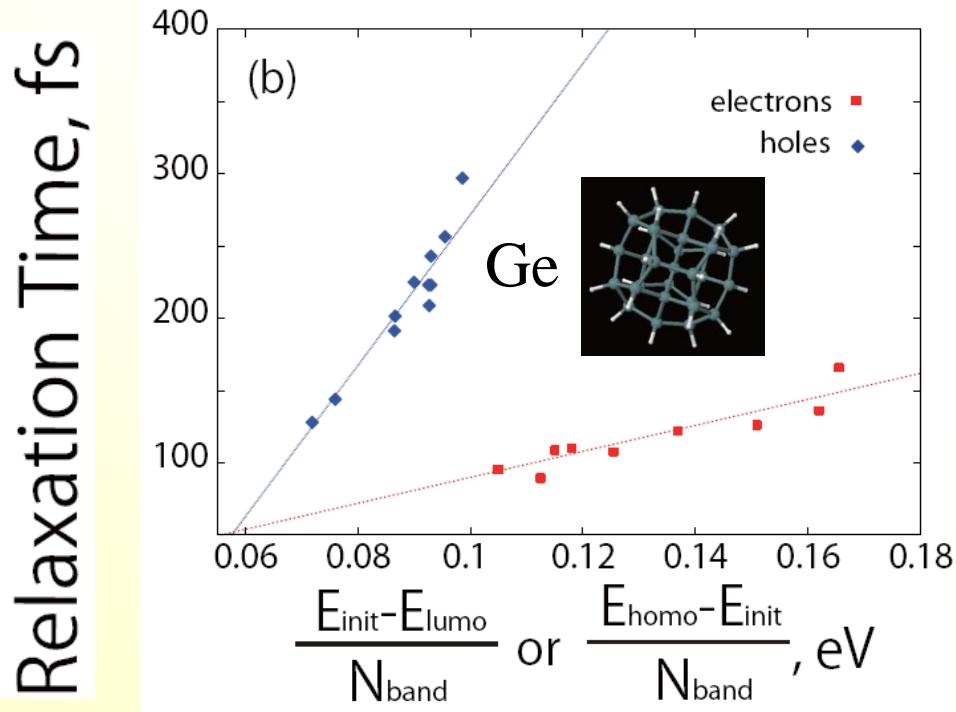

# Enhanced Energy Losses due to Ligands

Kim, Madrid, Prezhdo, *Dalton Trans.*, **45**, 10069 (2009)

Electrons relax much faster than holes ! (despite nearly symmetric DOS)

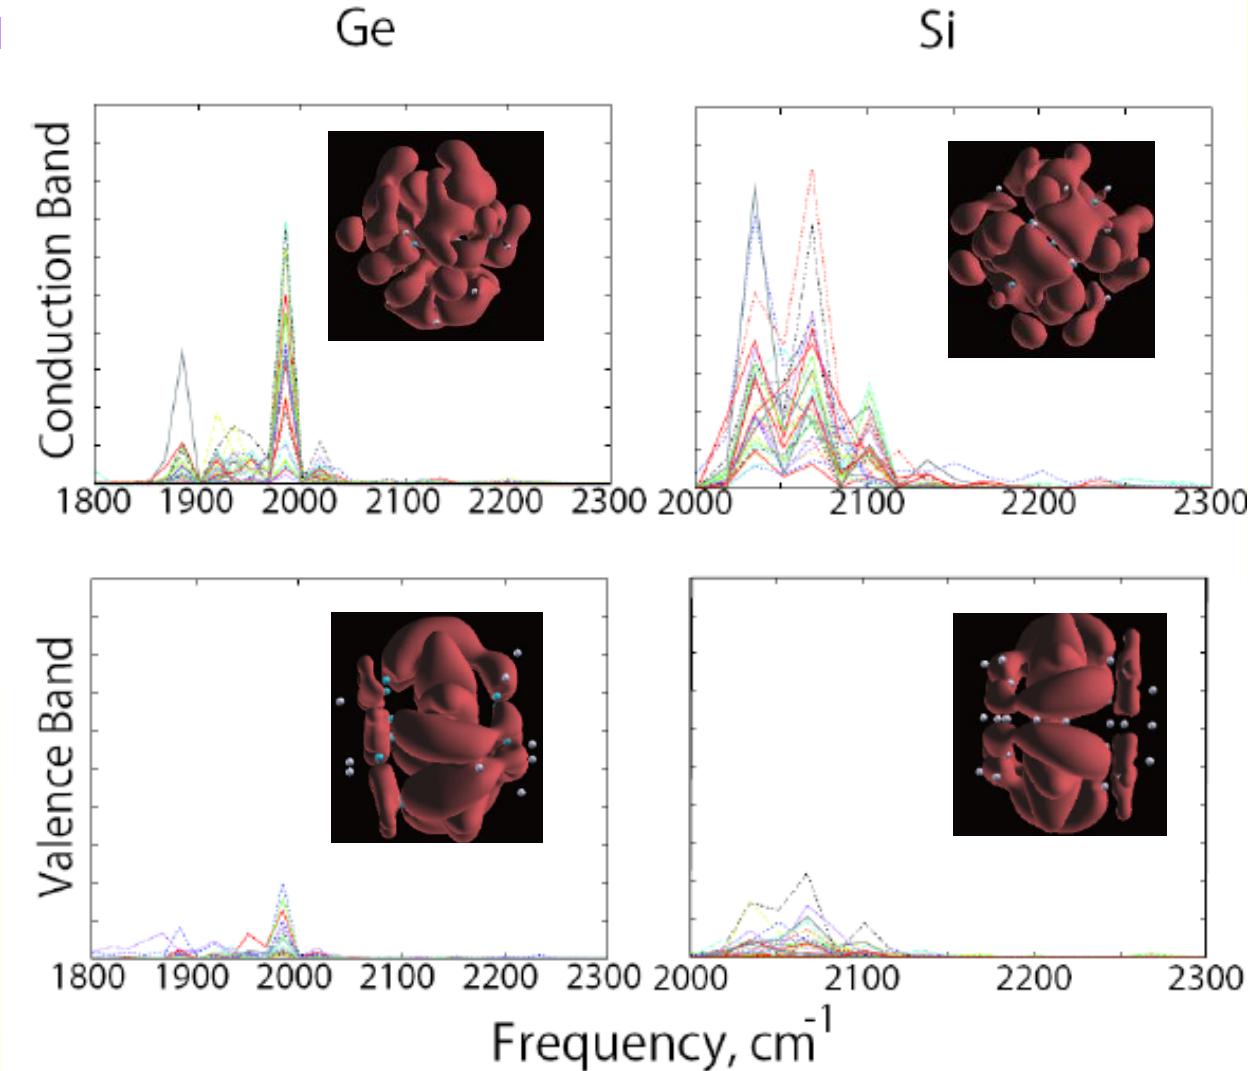

# Enhanced Energy Losses due to Ligands: Active Phonon Modes

Kim, Madrid, Prezhdo, *Dalton Trans.*, **45**, 10069 (2009)

Low frequency modes  
are active for both  
electrons and holes

However,  
high frequency  
(ligand)  
modes are active  
only for electrons

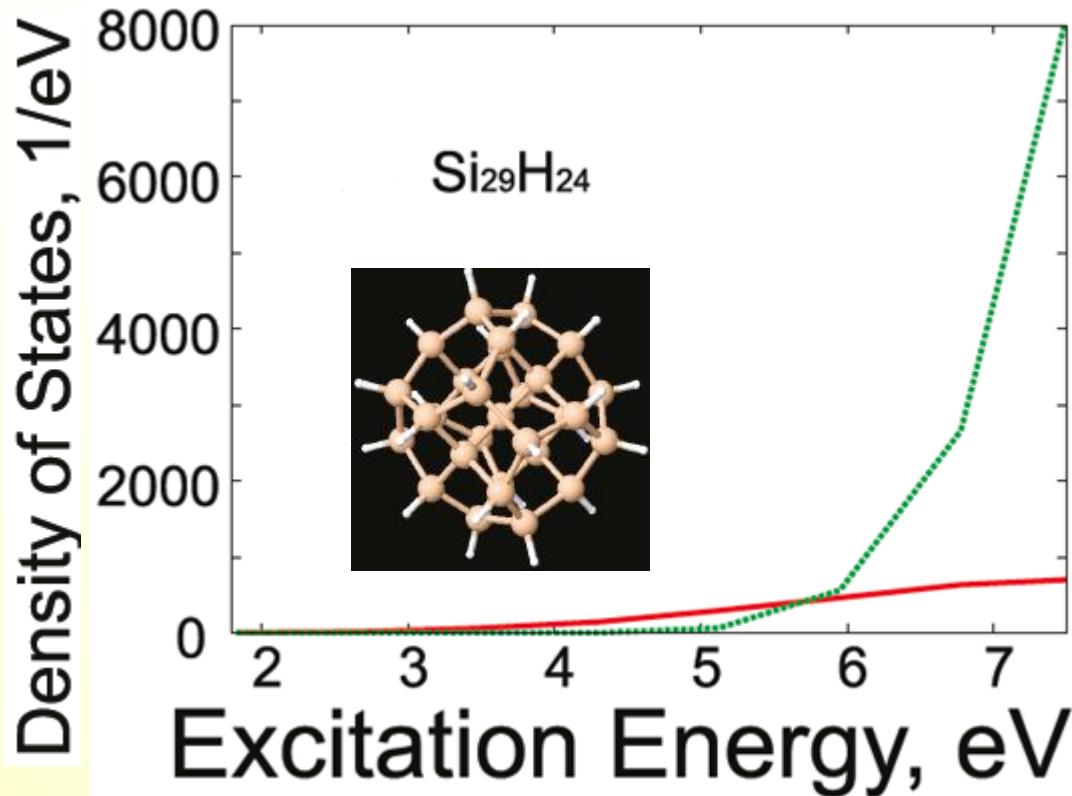

# Phonon-Assisted Auger Processes

Kim, Prezhdo, *Nano Lett.*, **11**, 1845 (2011)

Kim, Prezhdo, *ACS Nano*, **6**, 1239 (2012)

25 VB and 24 CB orbitals

**98,101 states** =  
ground+600SE+97,500DE  
(9,623,806,201  
matrix elements)

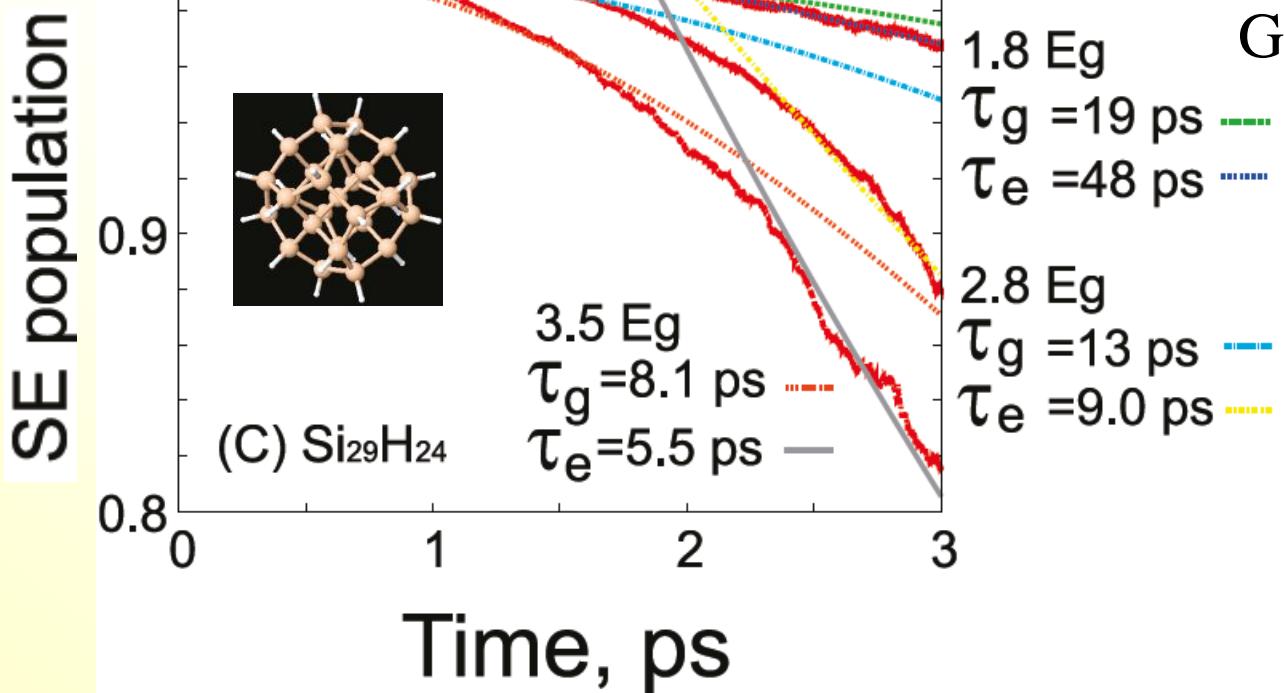

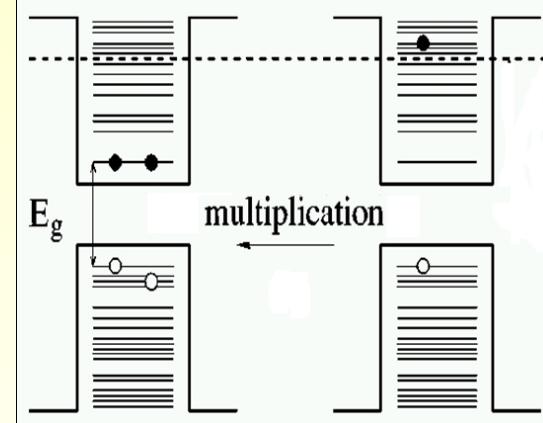

E<sub>g</sub> = 2.1 eV

SE & DE DOS  
cross at 5.8 eV

# ME Generation

Kim, Prezhdo, *Nano Lett.*, **11**, 1845 (2011)  
Kim, Prezhdo, *ACS Nano*, **6**, 1239 (2012)

Gaussian + Exponential

Rates increase  
with energy

Phonon-assisted  
Auger at energies  
less than  $2\text{E}_g$

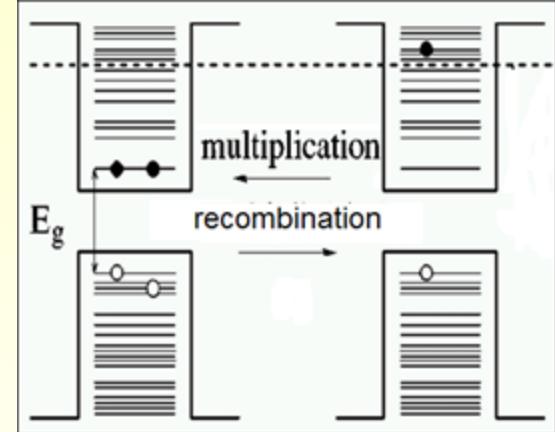

Auger processes are slower than electron-phonon relaxation,  
multiple excitons are created while interacting with light

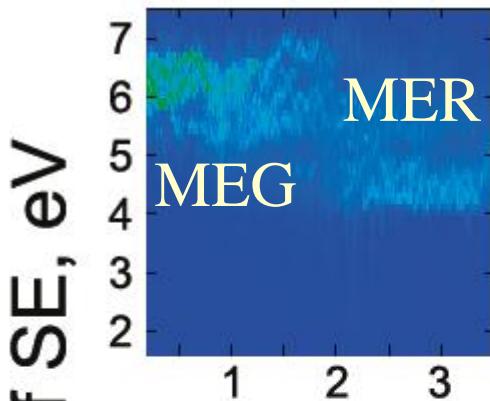

# ME Recombination

Kim, Prezhdo, *Nano Lett.*, **11**, 1845 (2011)

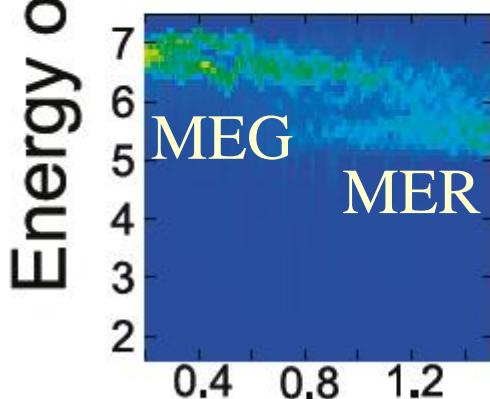

Kim, Prezhdo, *ACS Nano*, **6**, 1239 (2012)

## SE population

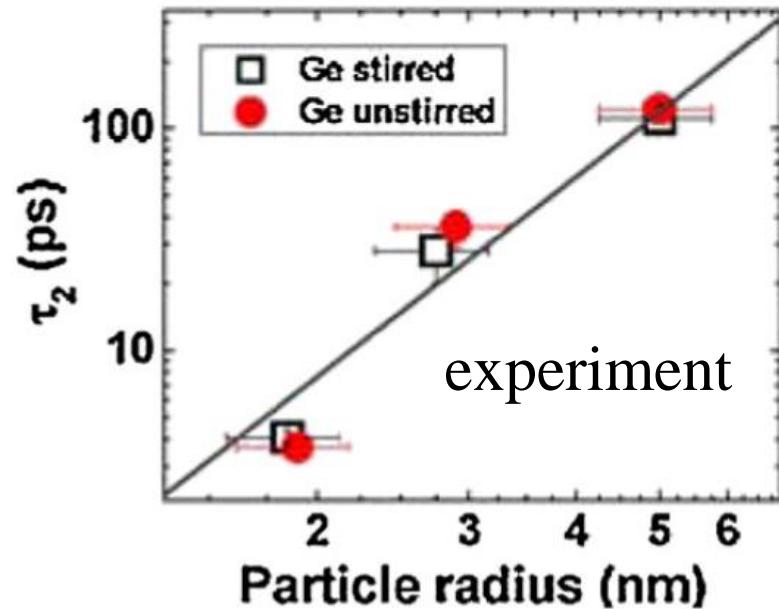

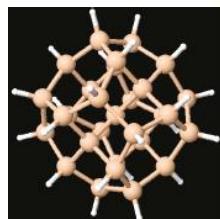

2.8 Eg

$\text{Si}_{29}\text{H}_{24}$

3.5 Eg

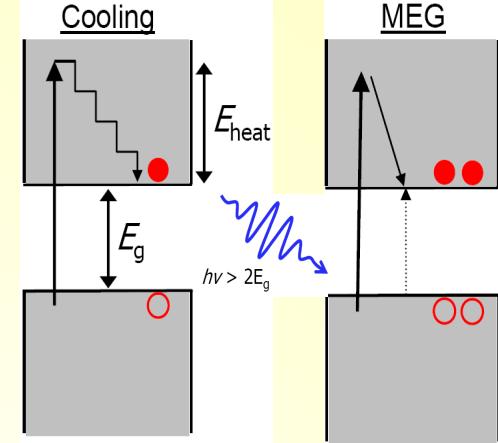

Robel et al. *PRL* **102** 177404 (2009)

sub-10ps for small QDs

rate theories give much longer times

# Electron-Phonon Dynamics in QDs

- ✓ Inelastic scattering on 10-100fs timescale (luminescence, single & multiple exciton coherences)
- ✓ Electron-phonon relaxation on a picosecond timescale
- ✓ Phonon bottleneck in special cases
- ✓ Phonon-assisted Auger processes are predicted
- ✓ Phonons drive adiabatic and nonadiabatic electron transfer

# Questions Arising in our Research

- When is classical description of phonons valid?
- What quantum corrections are needed and when (zero point energy, decoherence)?
- Are there alternatives to surface hopping; can one “derive” surface hopping?
- Surface hopping requires states, can we use DFT?
- Can we model light-matter interactions separate from electron-phonon dynamics?

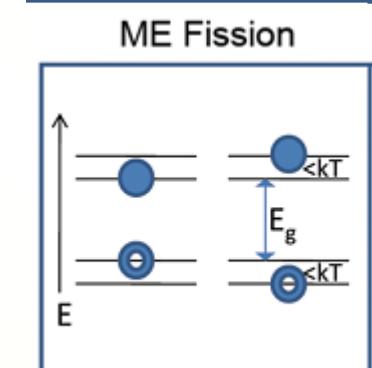

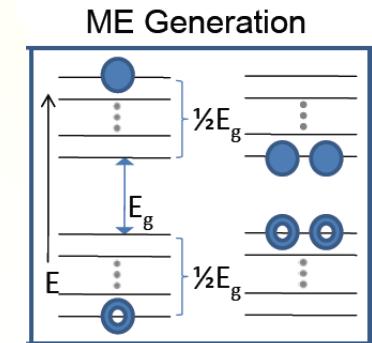

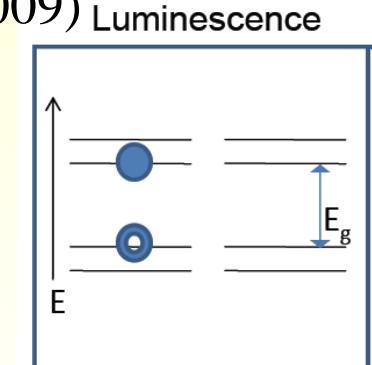

# Pure-Dephasing: Luminescence, ME Generation & ME Fission

Madrid, Hyeon-Deuk, Prezhdo, *ACS Nano* **3** 2487 (2009) Luminescence

## Phonon-induced pure-dephasing times, fs

T=300K/100K	Si <sub>29</sub> H <sub>24</sub>	Cd <sub>33</sub> Se <sub>33</sub>	Pb <sub>68</sub> Se <sub>68</sub>	Pb <sub>16</sub> Se <sub>16</sub>
Luminescence	4 / 7	10 / 16	9 / 23	7 / -
ME Generation	4 / 7	5 / 9	5 / 11	4 / -
ME Fission	80 / 310	-	-	-

Luminescence – 50meV linewidth, agree with exp.

ME Generation – rapid 10fs dephasing

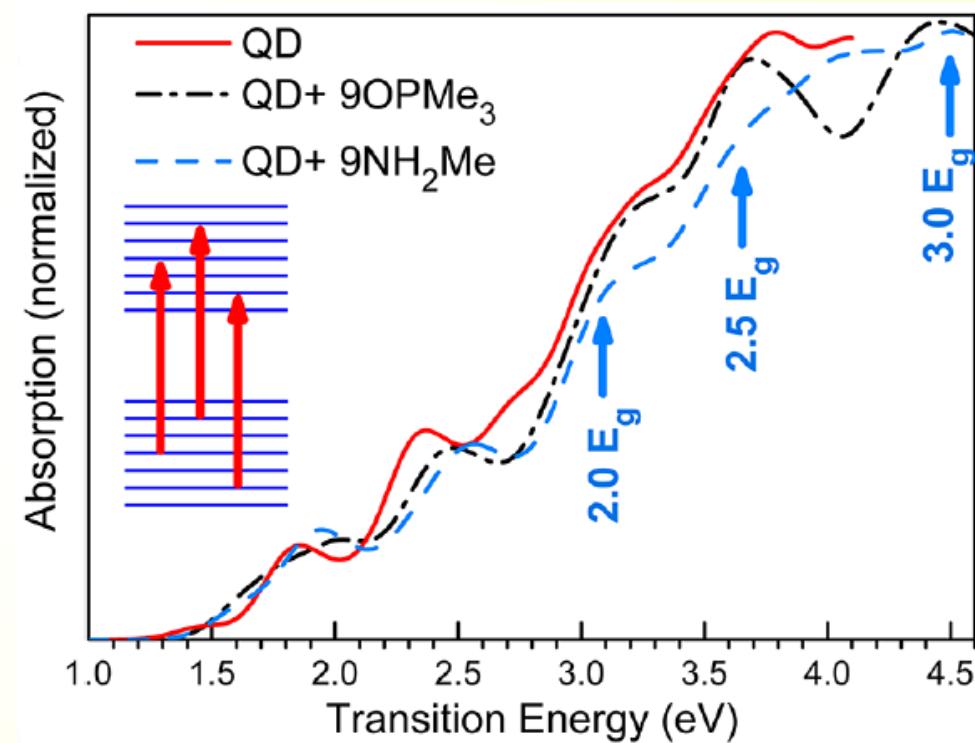

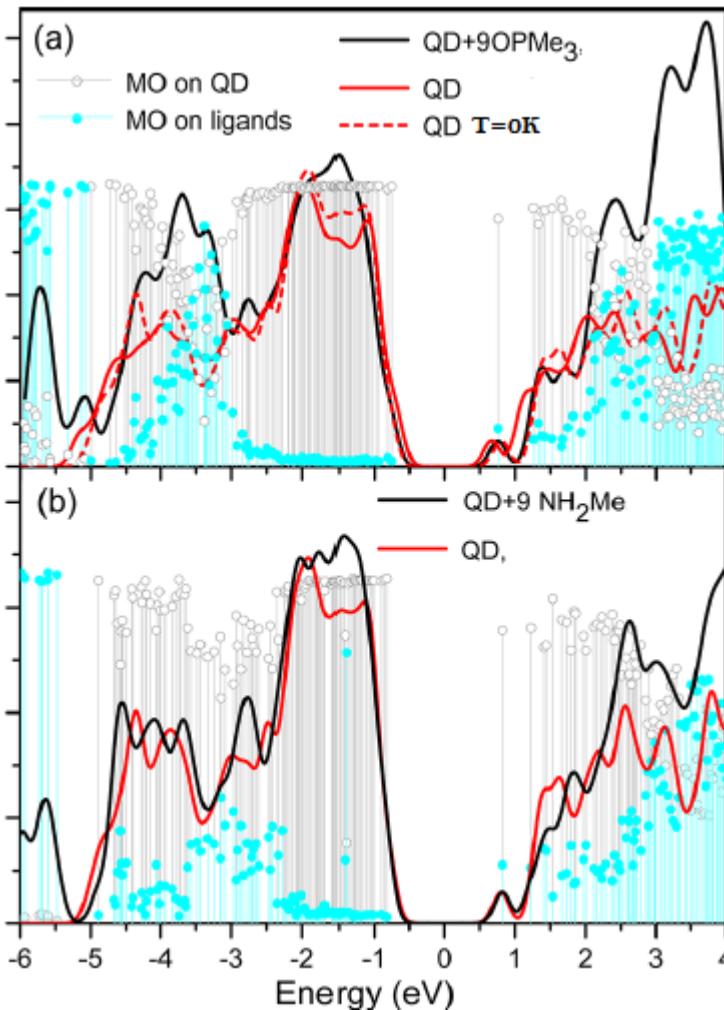

ME Fission – 100fs

# More Realistic Ligands: Electronic Structure

Kilina, Velizhanin, Ivanov, Prezhdo, Tretiak *ACS Nano*, **6**, 6515 (2012)

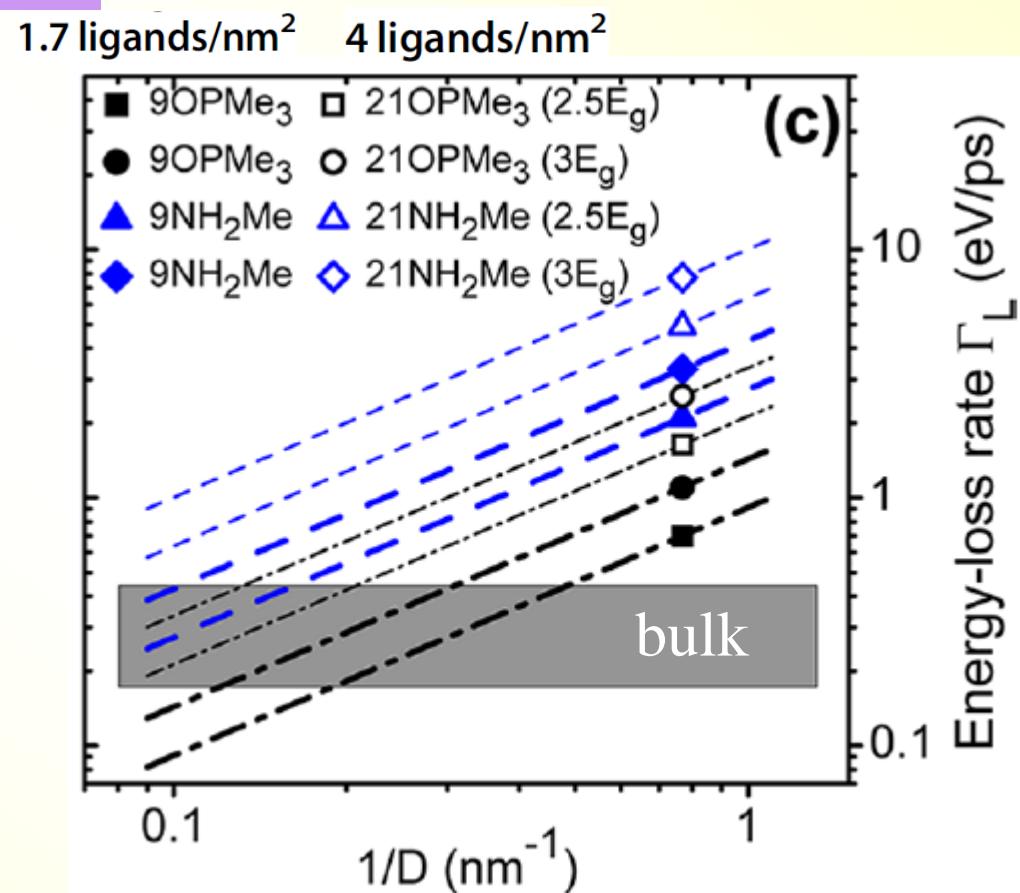

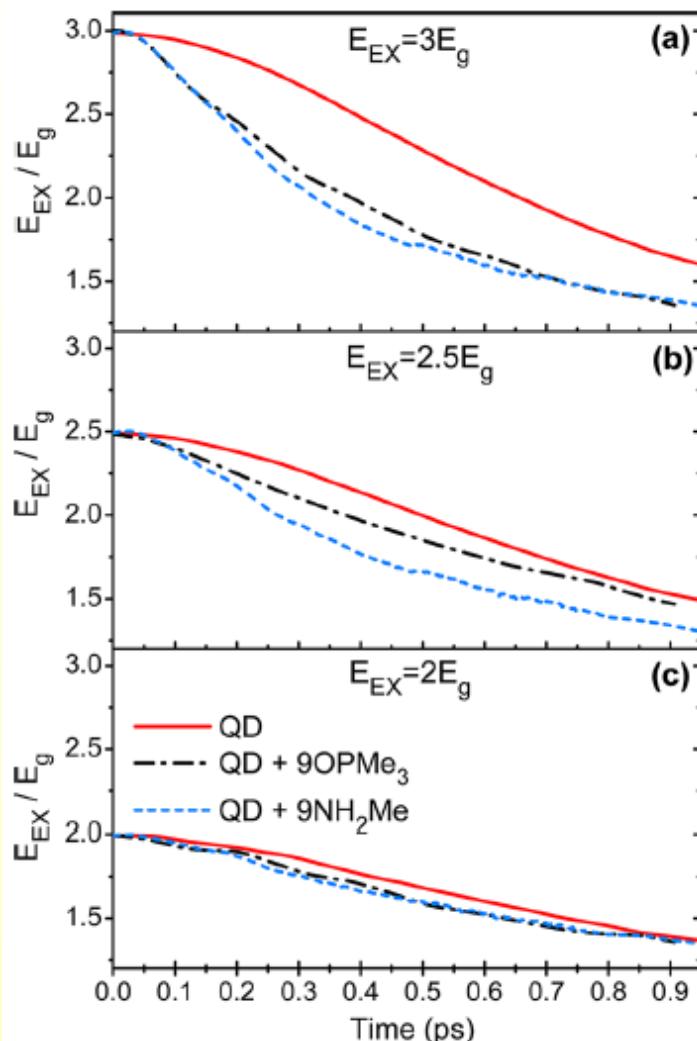

Ligands start contributing  
at energies of  $2.5-3E_g$

# Ligand Contribution to Electron-Phonon Relaxation

Kilina, Velizhanin, Ivanov, Prezhdo, Tretiak *ACS Nano*, **6**, 6515 (2012)

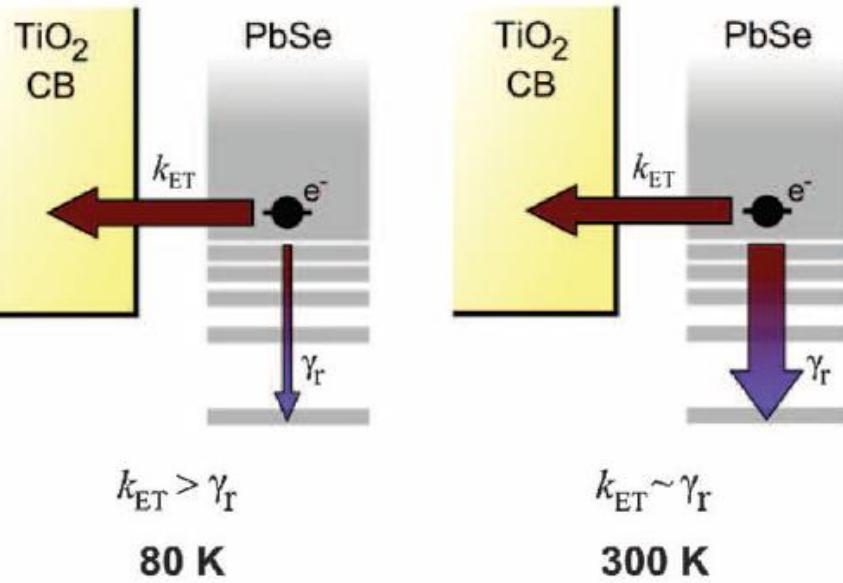

Ligands contributes up to 10nm QDs

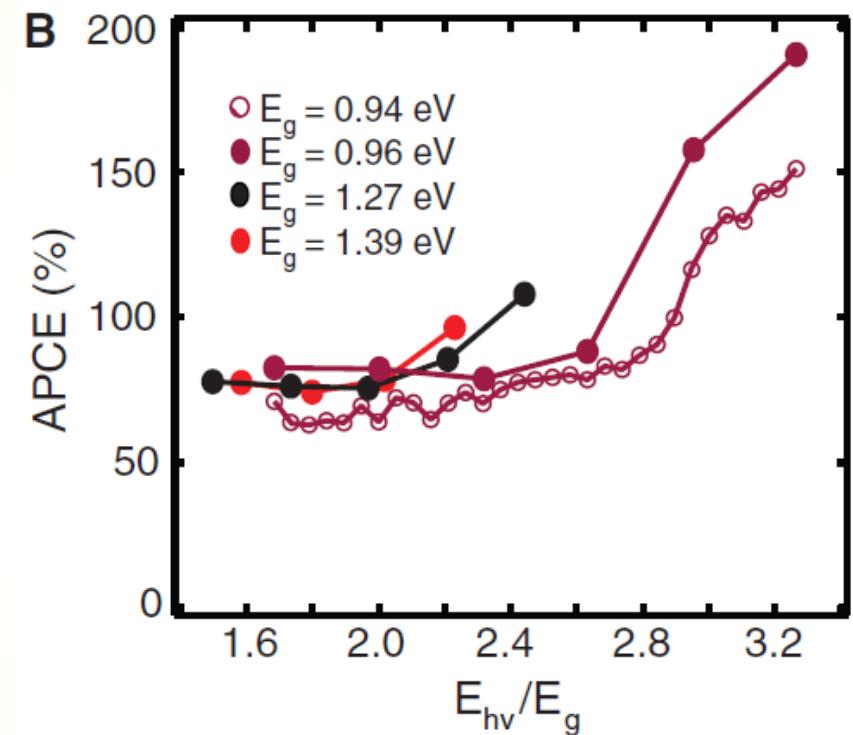

# Electron Transfer from QDs to TiO<sub>2</sub>

50 fs injection time

Zhu group, *Science* **328** 1543 (2010)

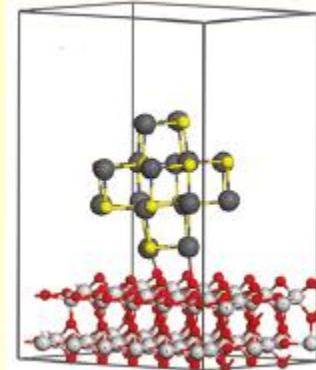

absorbed photon-to-current efficiency

Parkinson group, *Science* **330** 63 (2010)

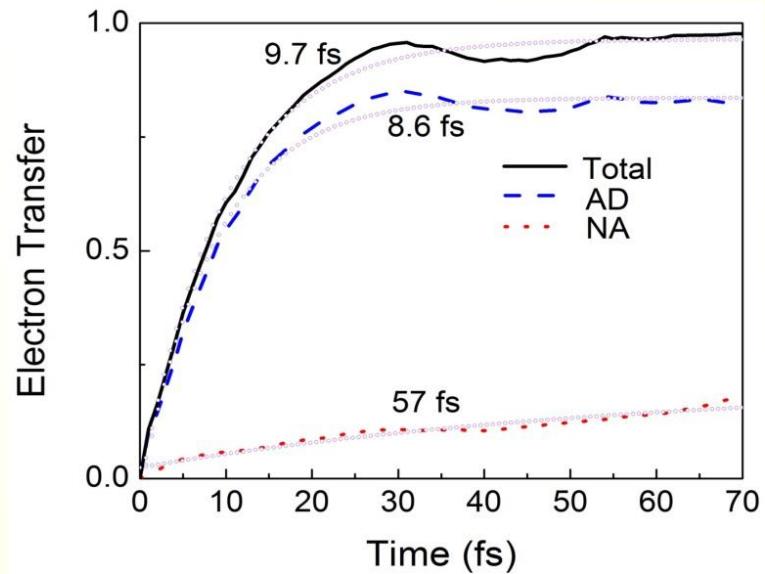

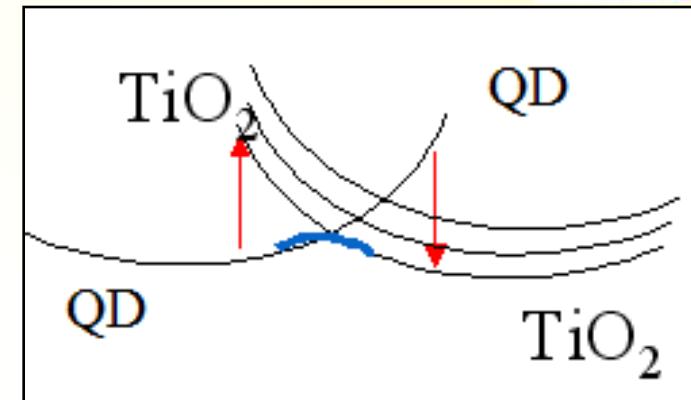

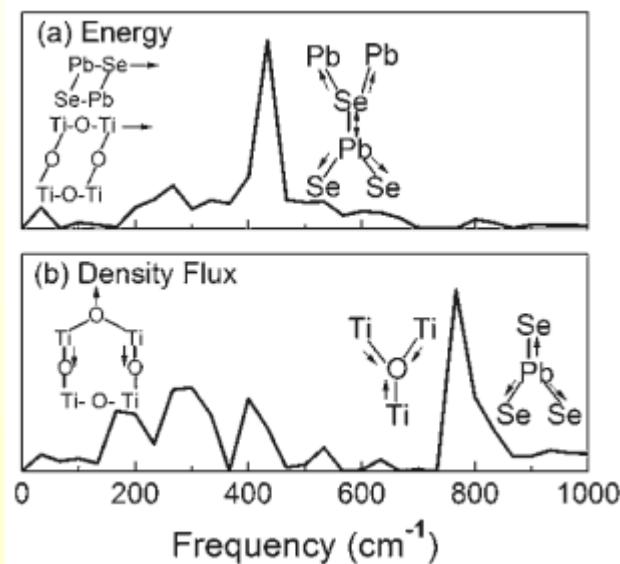

# $e^-$ transfer from QDs to $TiO_2$

Long, Prezhdo J. Am. Chem. Soc. **133** 19240 (2011)

- 10 fs time; mostly adiabatic ET  
strong donor-acceptor coupling
- ET is driven by high frequency polar phonons

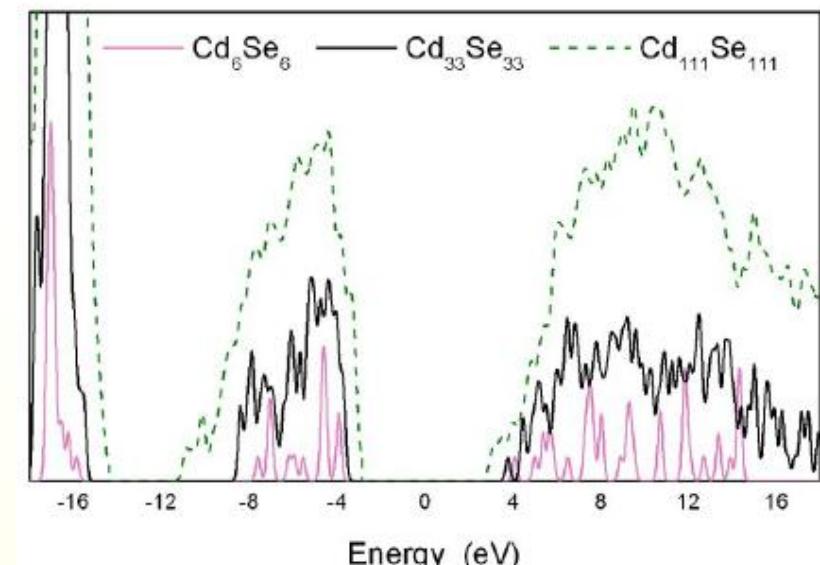

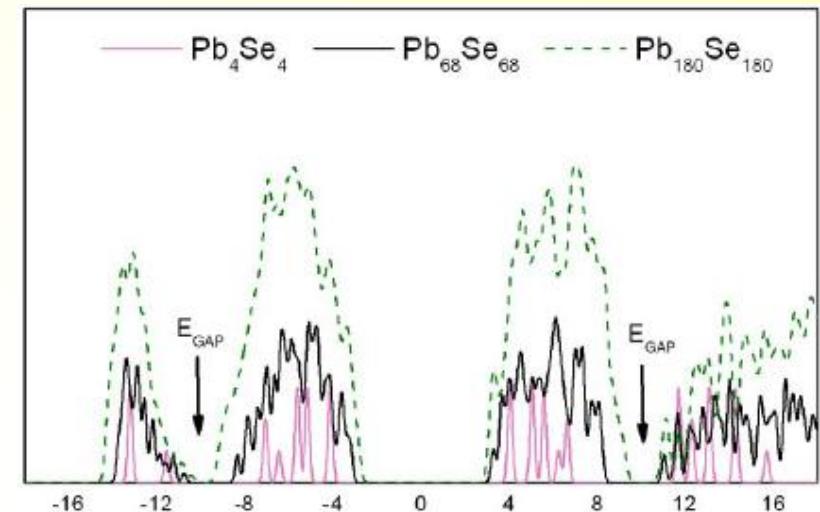

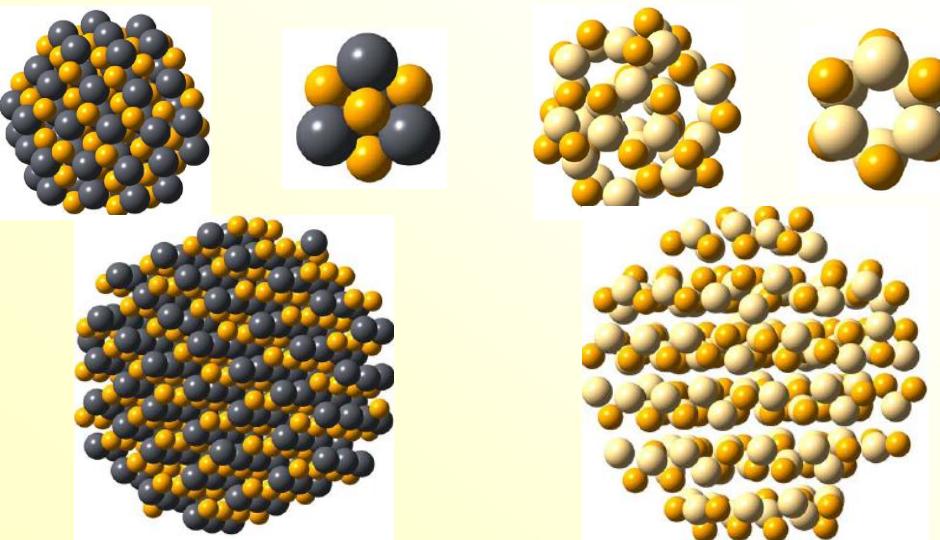

# Hartree-Fock Band Structure

Fischer, Isborn, Prezhdo, *Chem. Science*, **2**, 400 (2011)

1. Small dots represent large dot DOS
2. Huge one-electron gap
3. Symmetric vs. asymmetric DOS
4. Secondary gaps in PbSe DOS

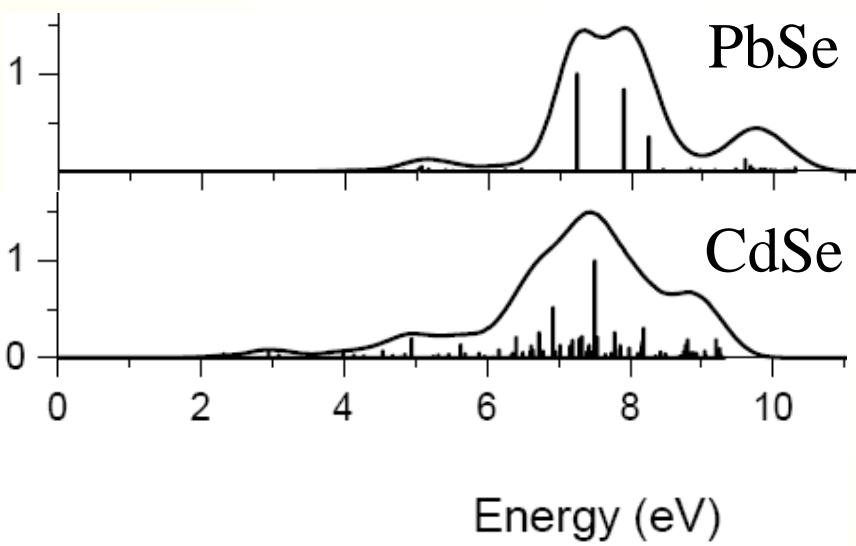

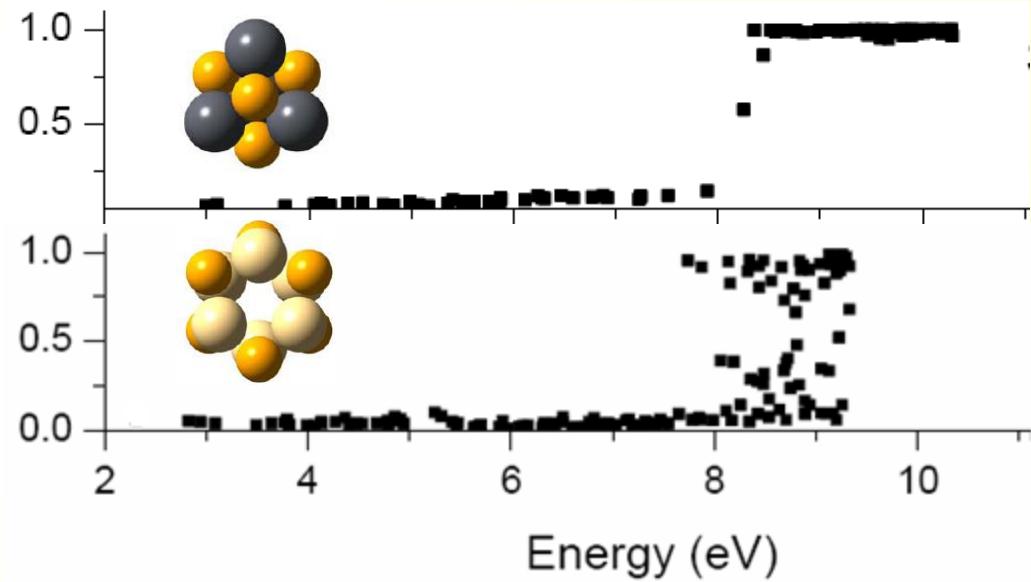

# Spectra and Multiple Excitons

Fischer, Isborn, Prezhdo, *Chem. Science*, **2**, 400 (2011)

spectra (SAC-CI calculations)

fraction of multiple excitons

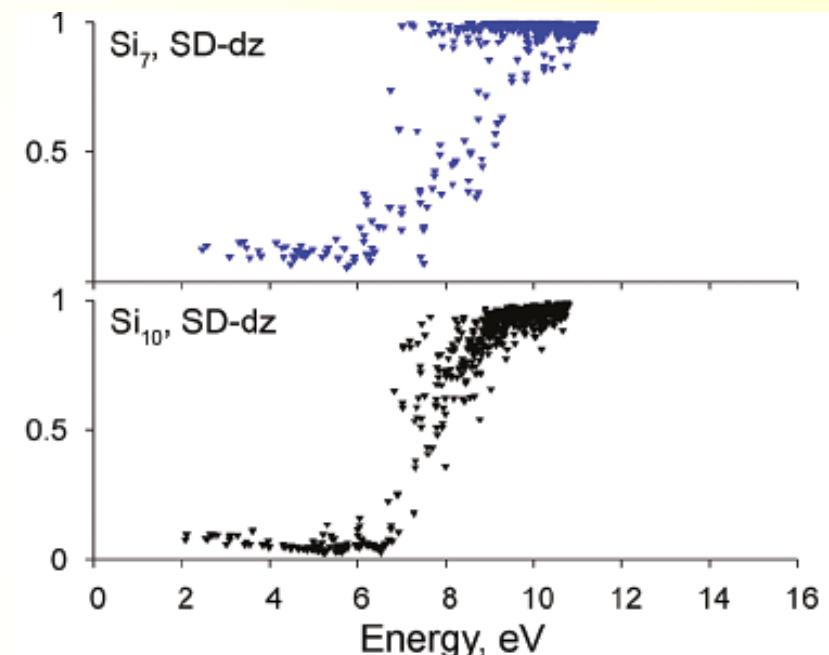

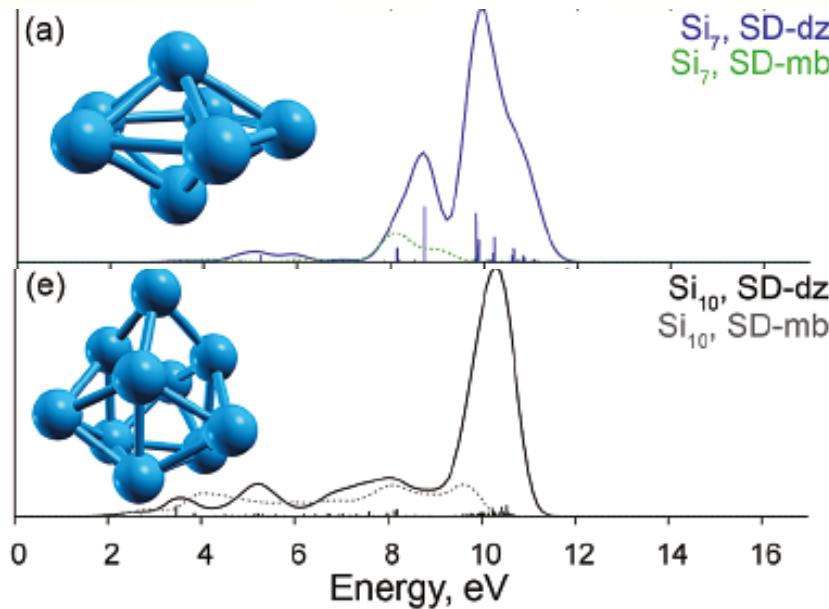

CdSe spectra agree  
with experiment  
*JACS* **128**, 629 (2006)

1. Sharp onset of multiple excitons
2. Above threshold: double excitons in PbSe; single, double and superpositions in CdSe

# Direct Mechanism: Si Clusters

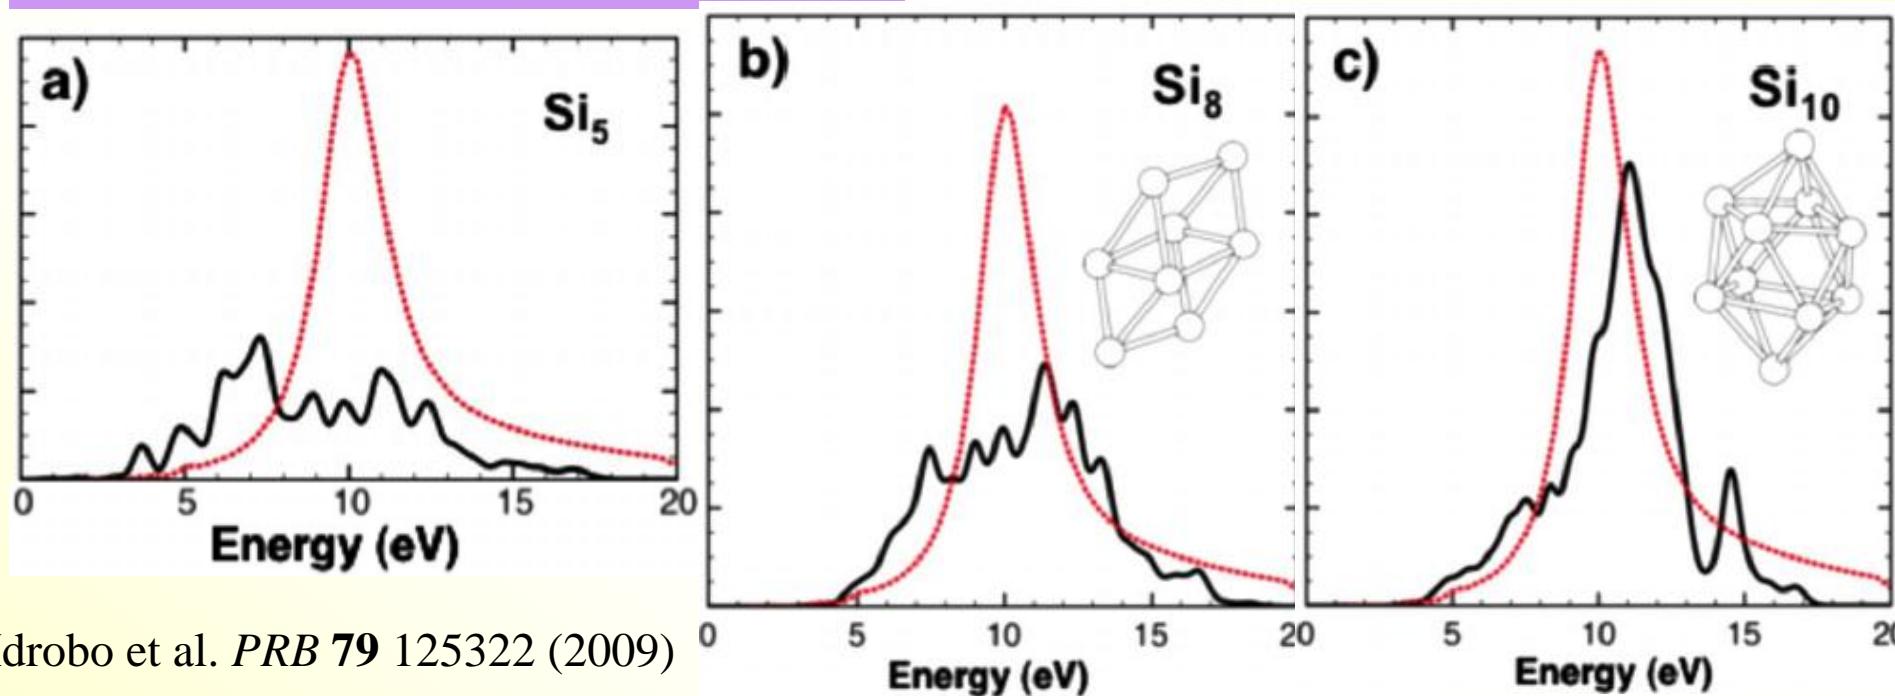

spectra

1. Complete and fairly sharp transition
2. Si is more similar to PbSe than CdSe due to symmetric band structure

# Universal Optical Response in Si Clusters

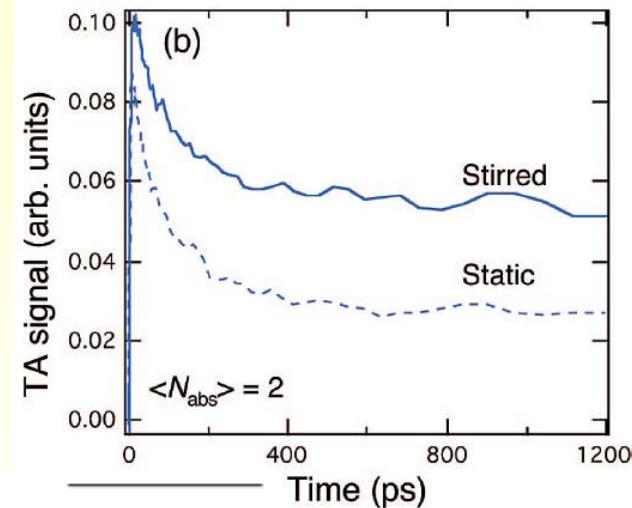

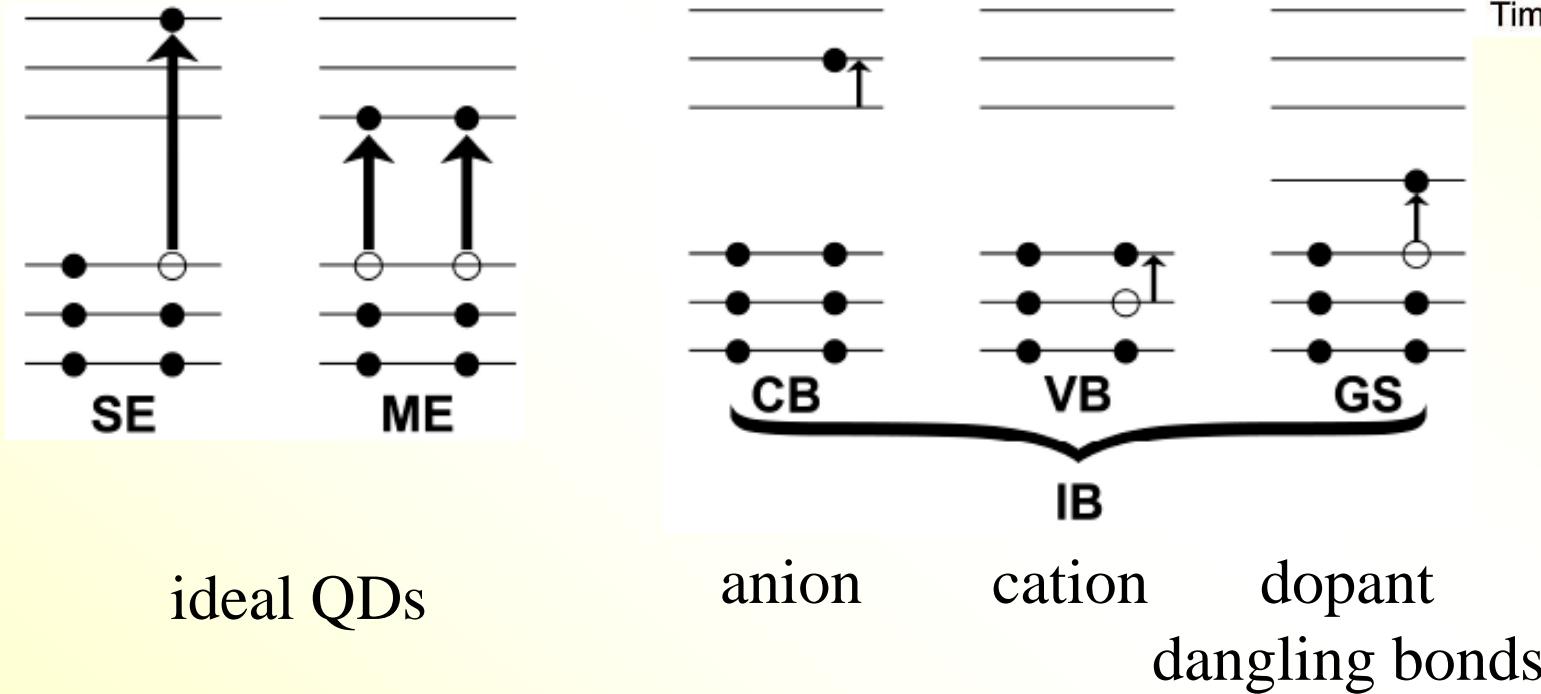

Idrobo et al. *PRB* **79** 125322 (2009)

$$\sigma_{\text{abs}}(\omega) = \frac{9\omega V}{c} \frac{\epsilon_2(\omega)}{[\epsilon_1(\omega) + 2]^2 + \epsilon_2(\omega)^2}$$

Classical Mie theory matches ab initio calculations on very small clusters, independent of bonding configuration

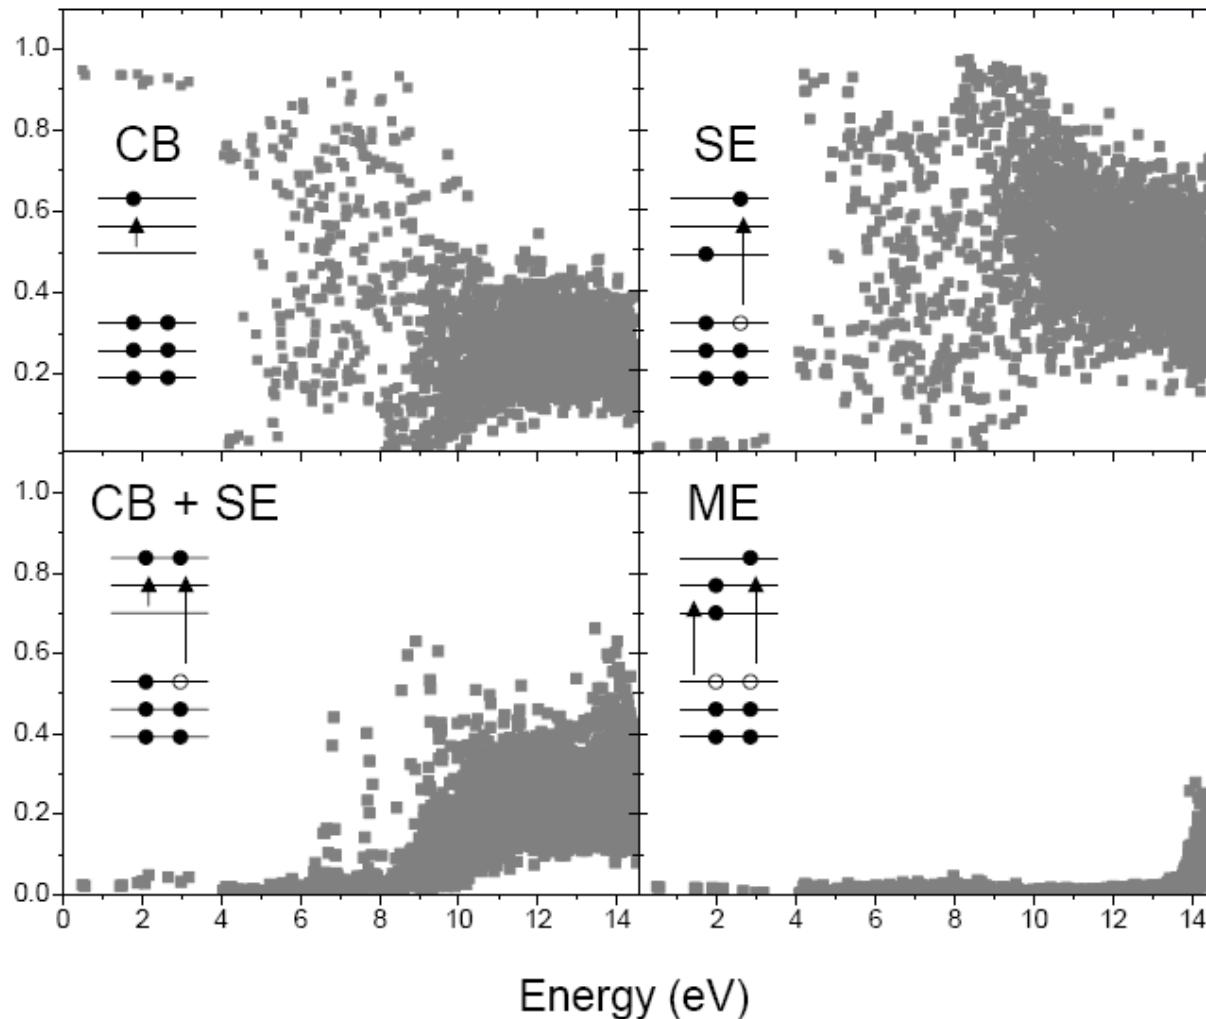

# Defects Introduce New Transitions

# Calculations for Charged PbSe Dots

Fischer, Isborn, Prezhdo, *Chem. Science*, **2**, 400 (2011)

Conduction band  
transitions  
overwhelm MEs

Much higher  
ME threshold
