# Structures of $\text{Fe}_2\text{O}_3$ (0001) surface

---

--- O<sub>3</sub> - Fe - Fe - O<sub>3</sub> - Fe - Fe - O<sub>3</sub> - Fe - Fe - O<sub>3</sub> - ...

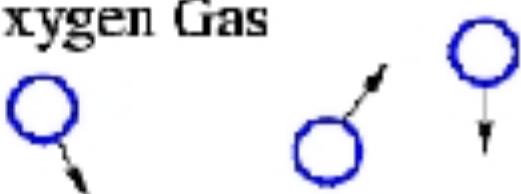

---

Type of

surface:    O<sub>3</sub> FeFe ...    FeO<sub>3</sub> Fe ...    FeFe O<sub>3</sub> ...    O<sub>3</sub> FeFe ...    O<sub>1</sub> FeFe ...

Oxygen Gas

$$\mu_O < \mu_O(\text{gas})$$

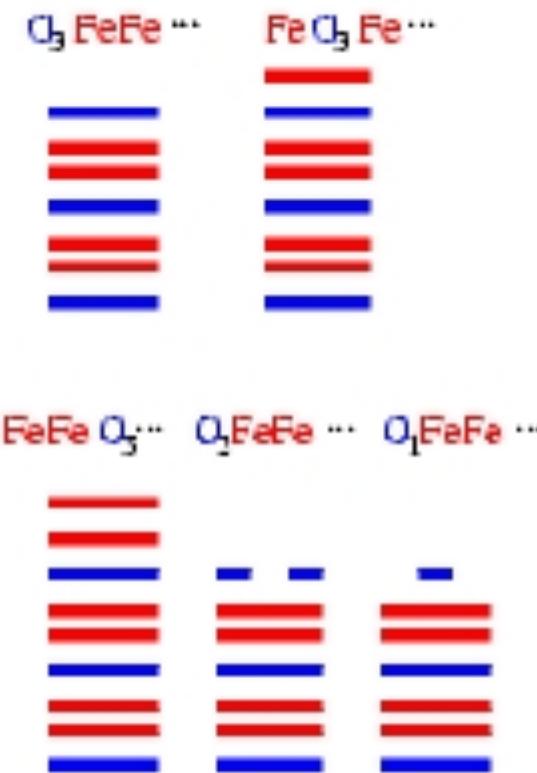

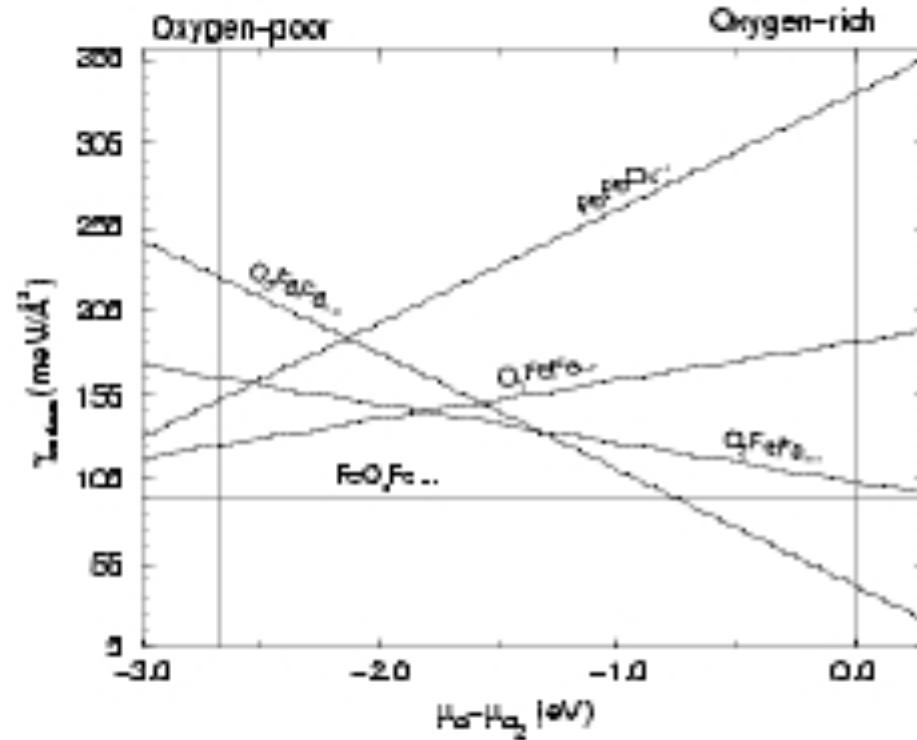

$$\mu_{Fe} < \mu_{Fe}(\text{bulk})$$

Surface

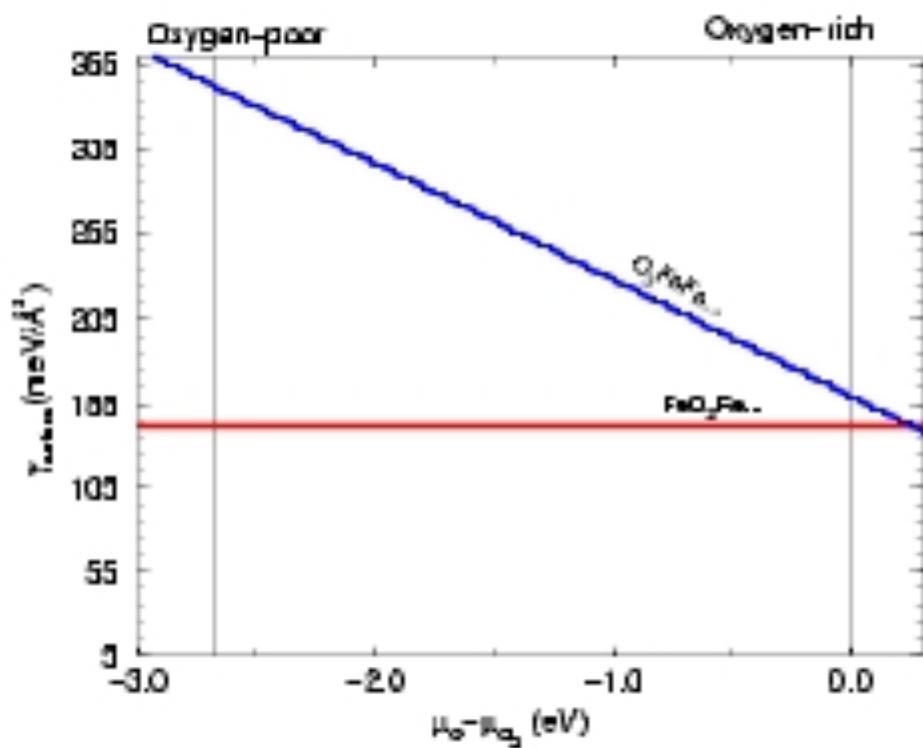

Fe<sub>2</sub>O<sub>3</sub> Bulk

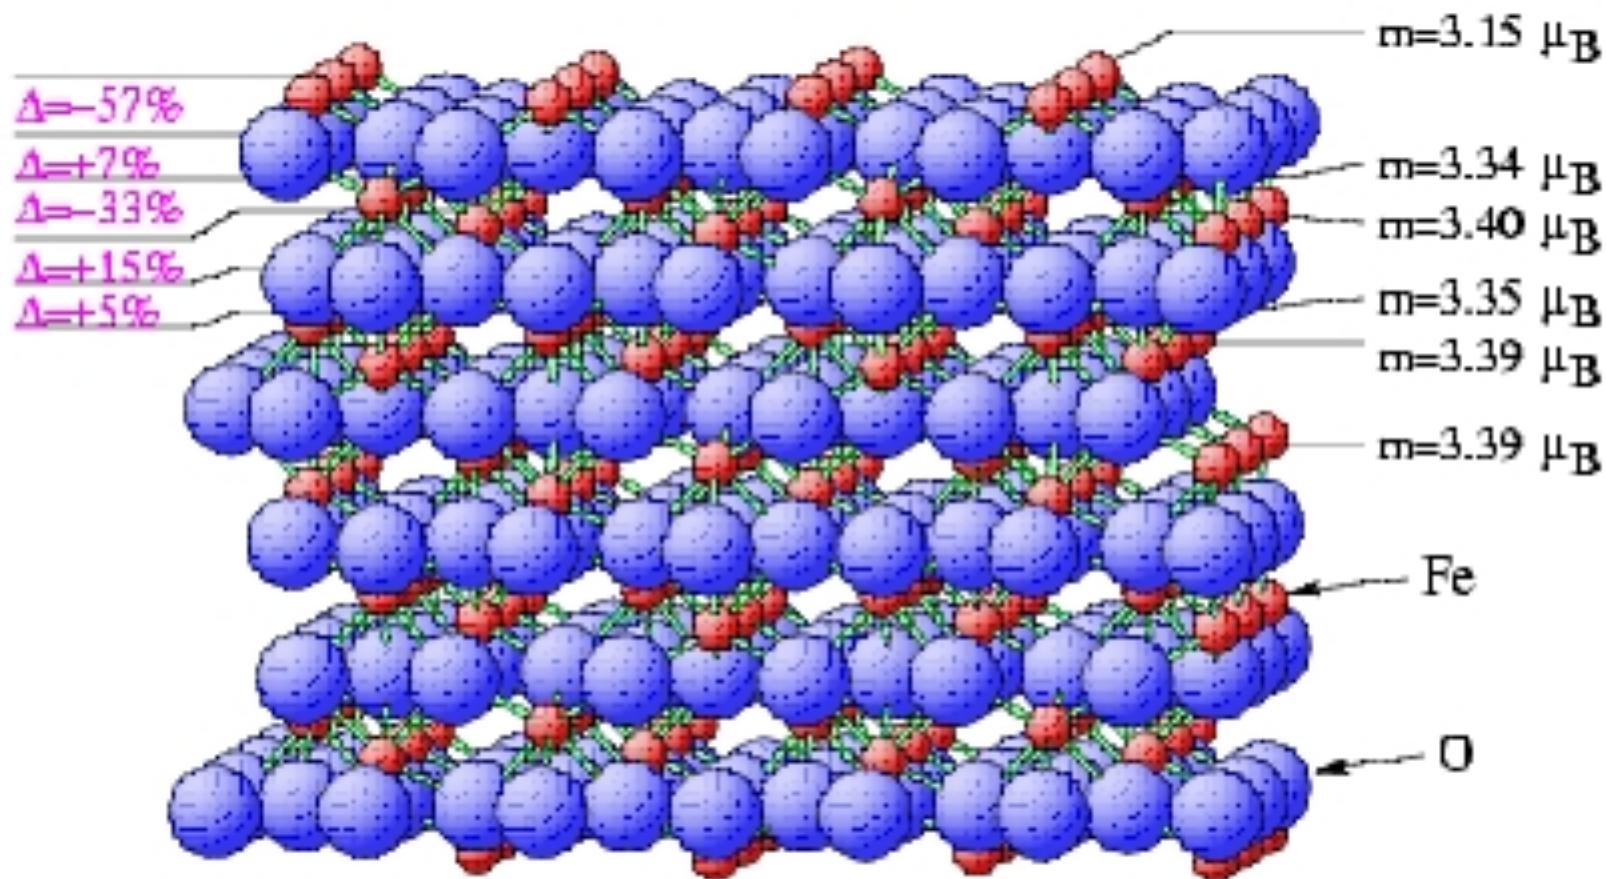

$$2\mu_{Fe} + 3\mu_O = \mu_{Fe_2O_3}$$

### Relaxed Fe<sub>2</sub>O<sub>3</sub> (0001) surfaces

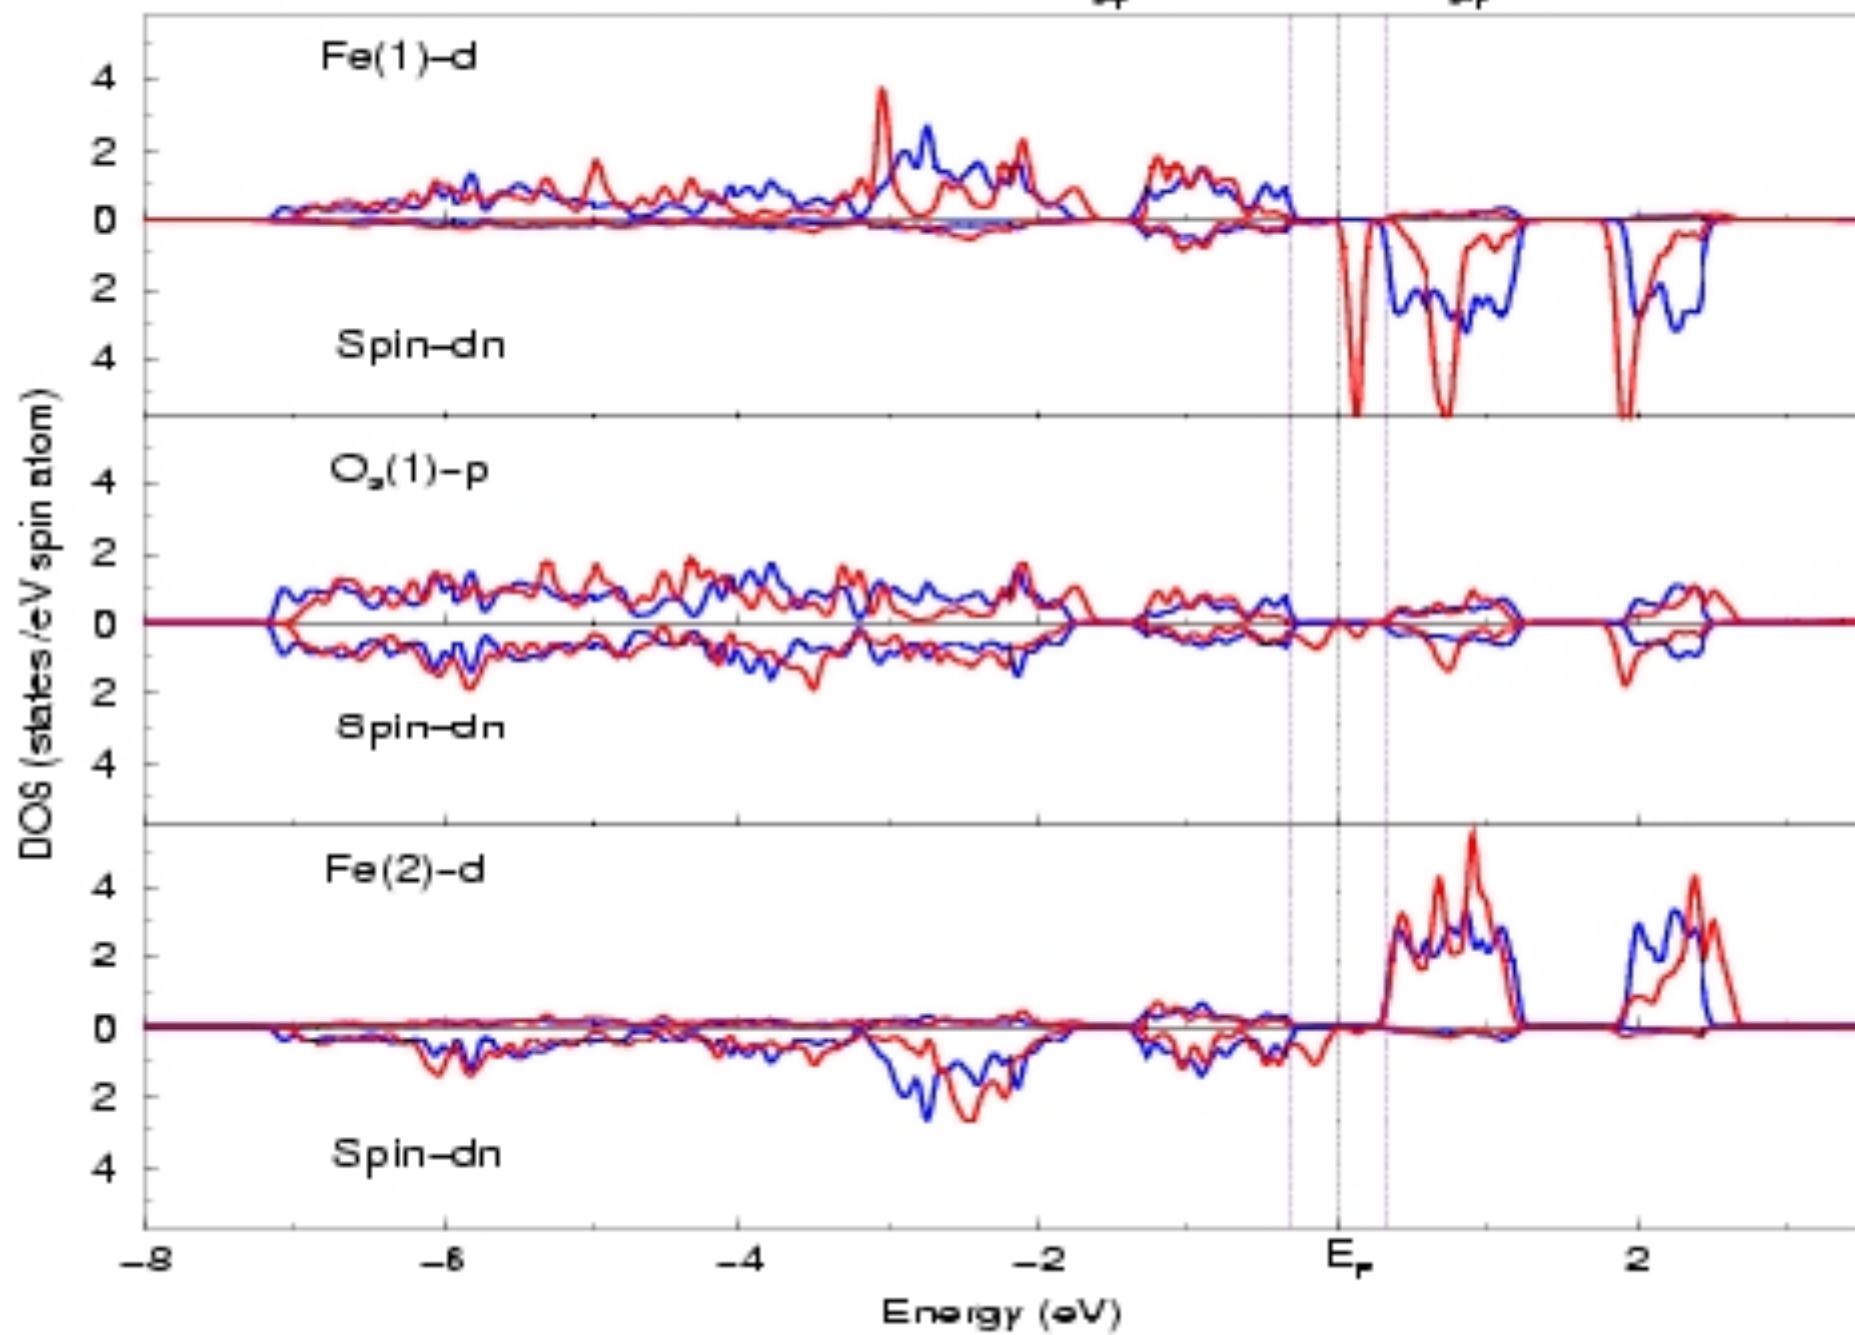

## Un-relaxed $\text{Fe}_2\text{O}_3$ (0001) surfaces

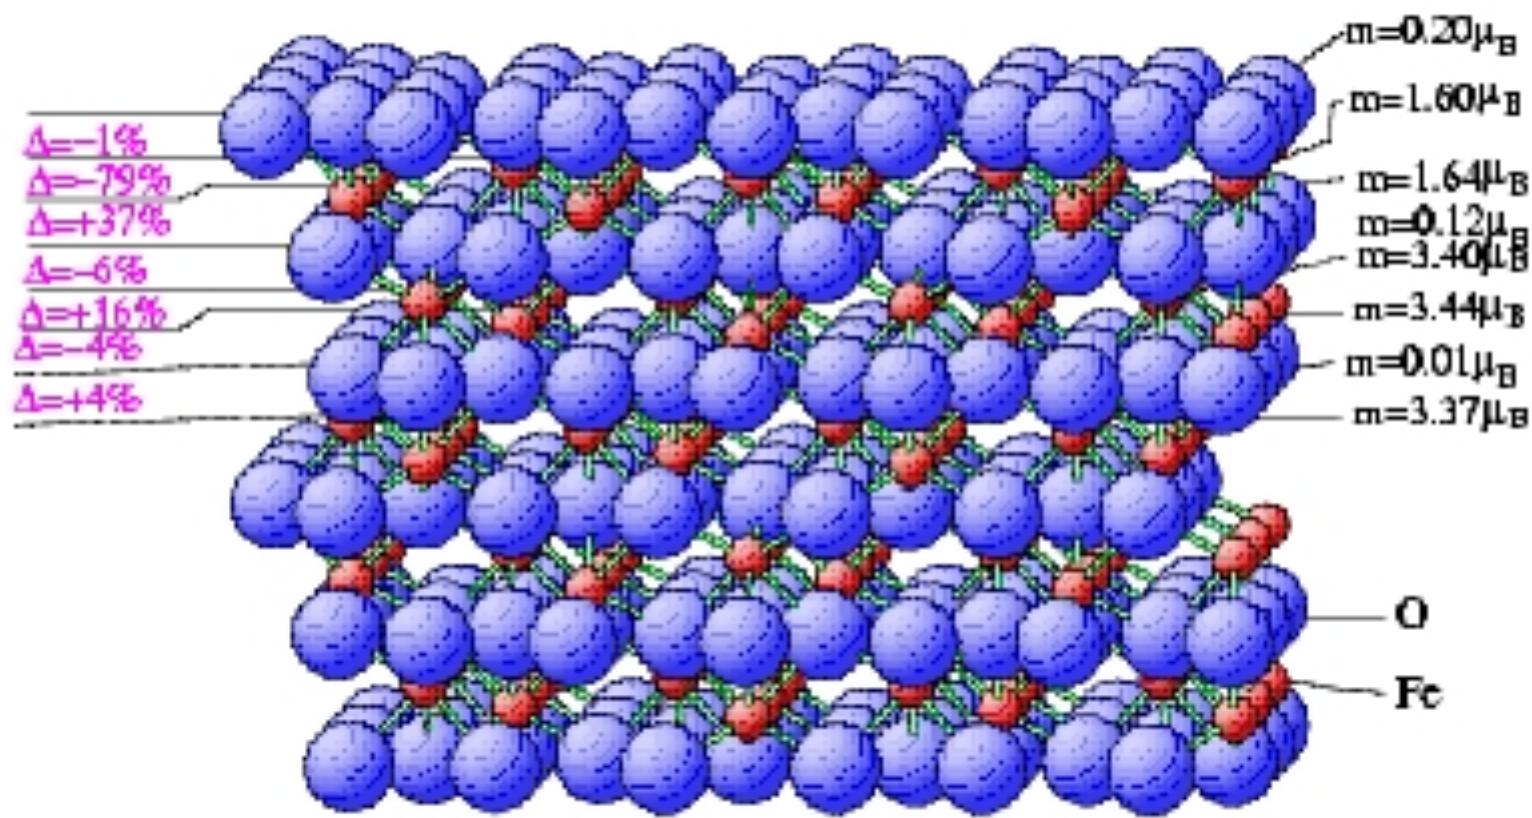

# Partial DOS for Fe-terminated surface

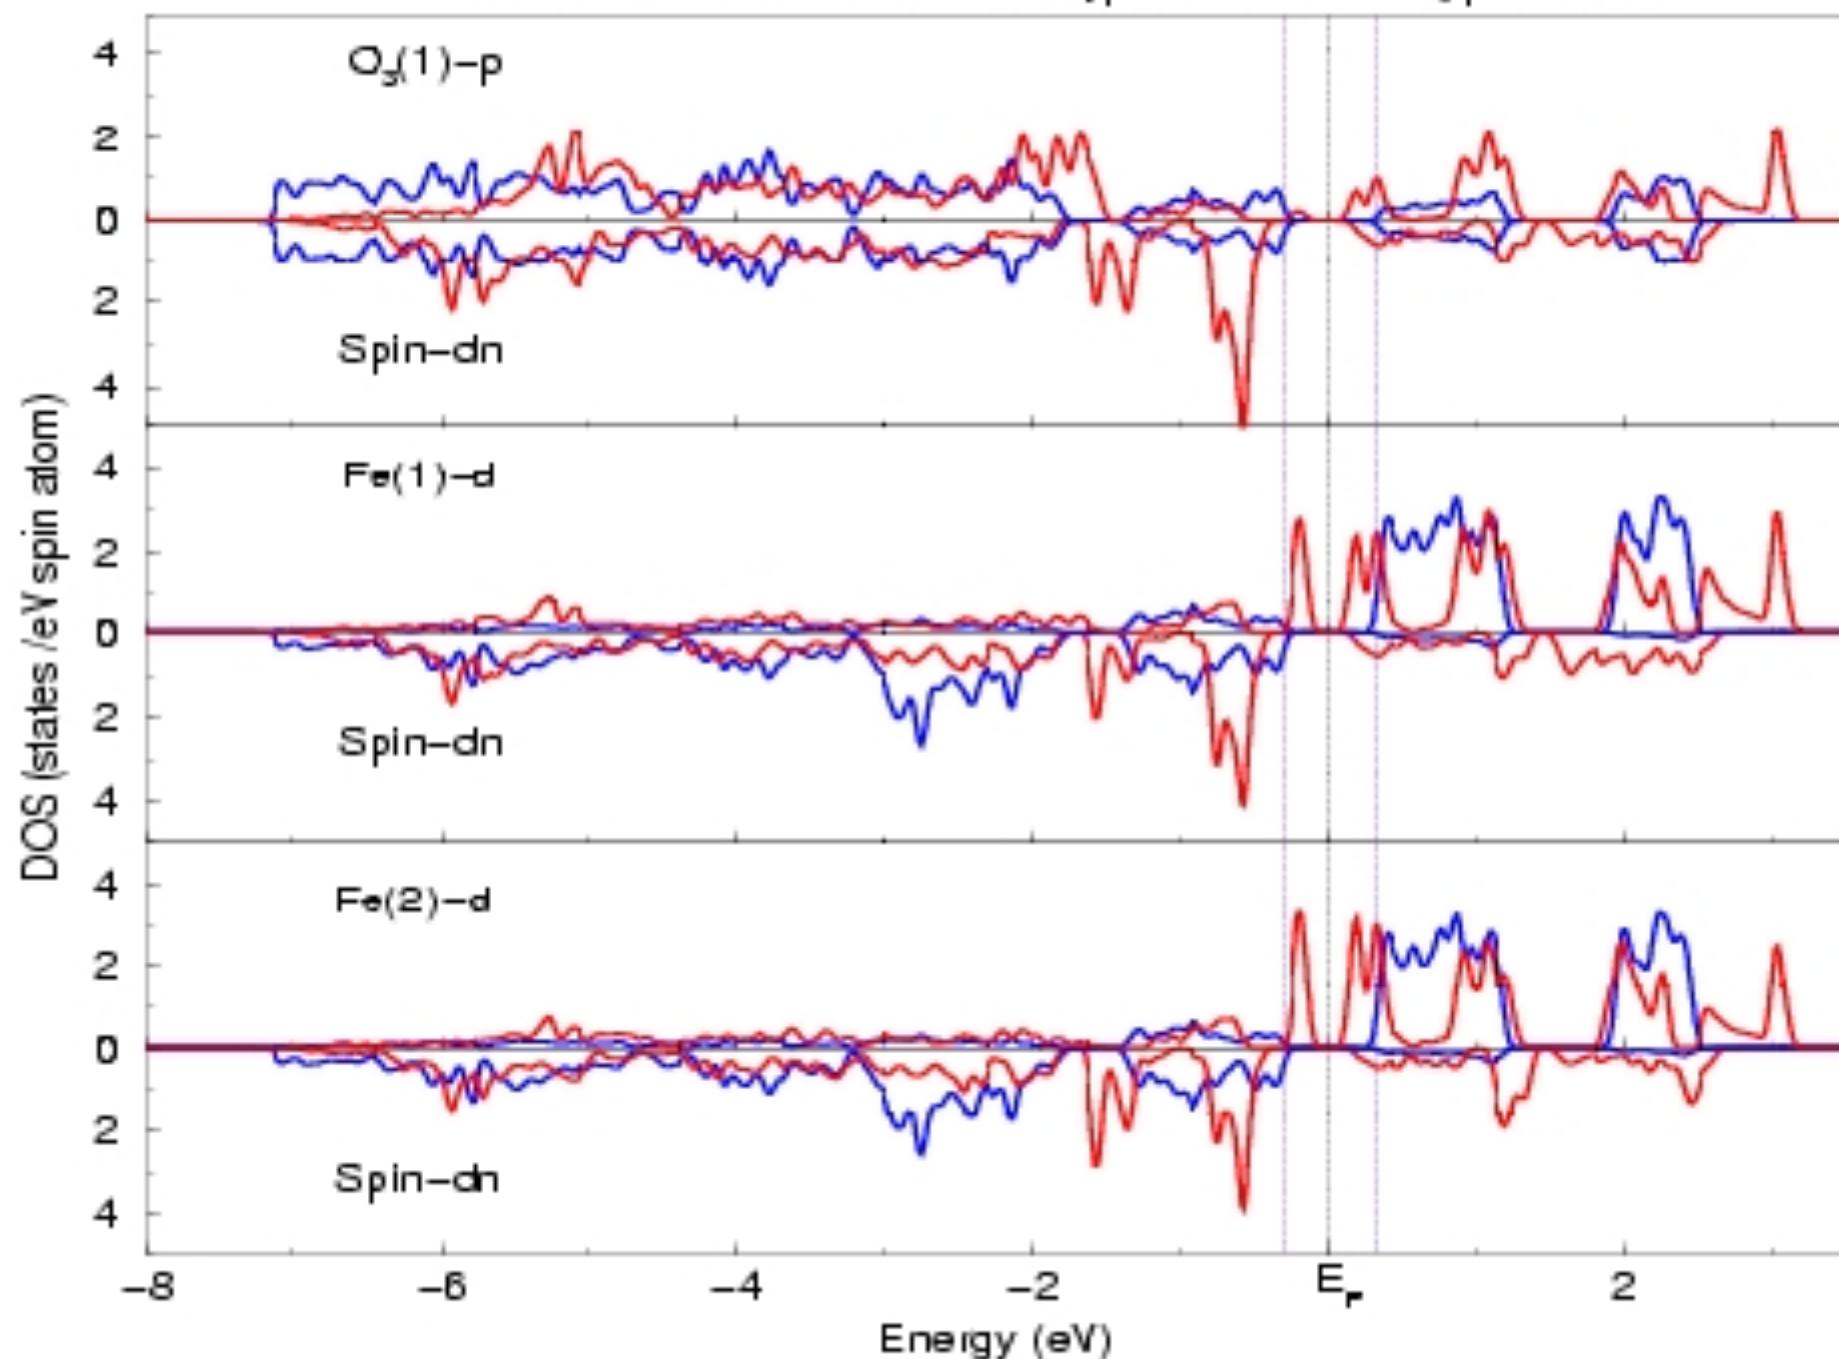

Gaussian width 0.03 eV, red color for surface;  $\Delta E_{\text{gap}}(\text{bulk})=0.64 \text{ eV}$ ,  $\Delta E_{\text{gap}}(\text{S})=0.10 \text{ eV}$

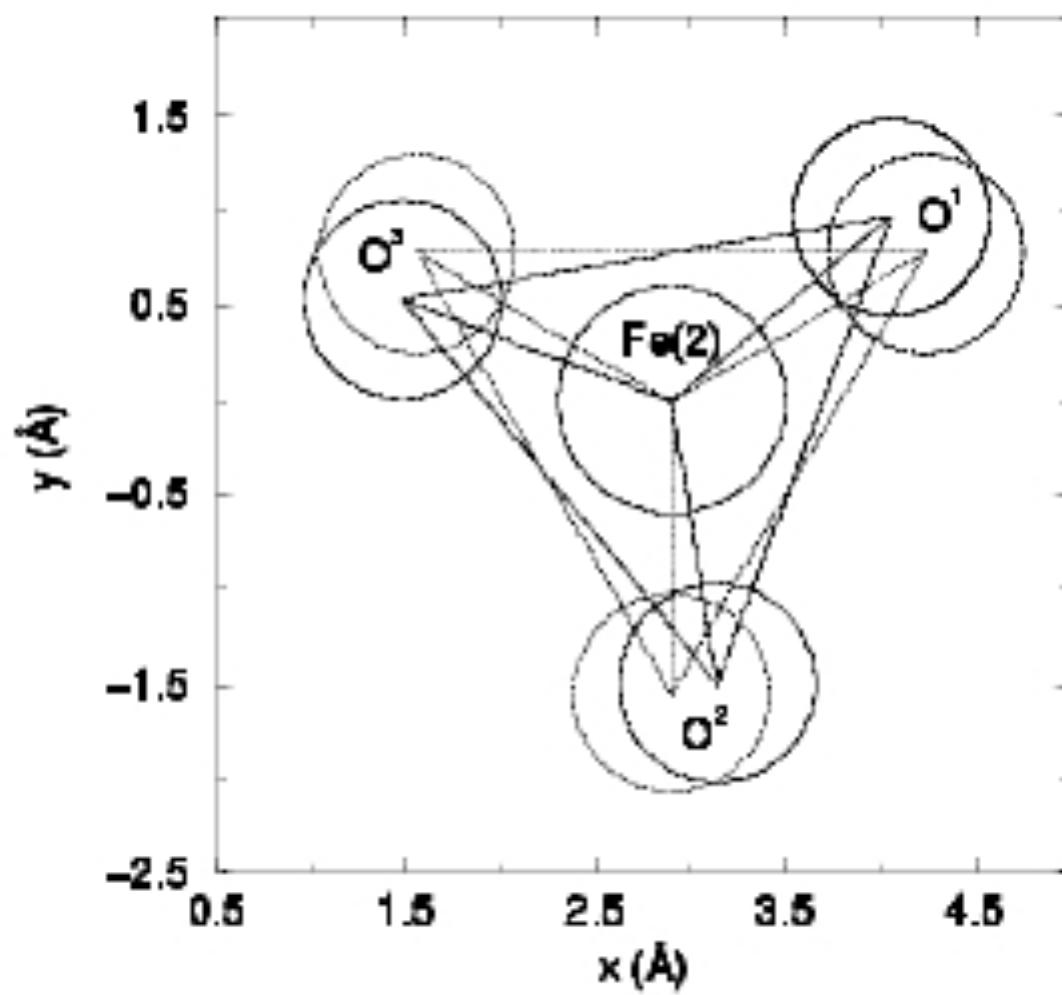

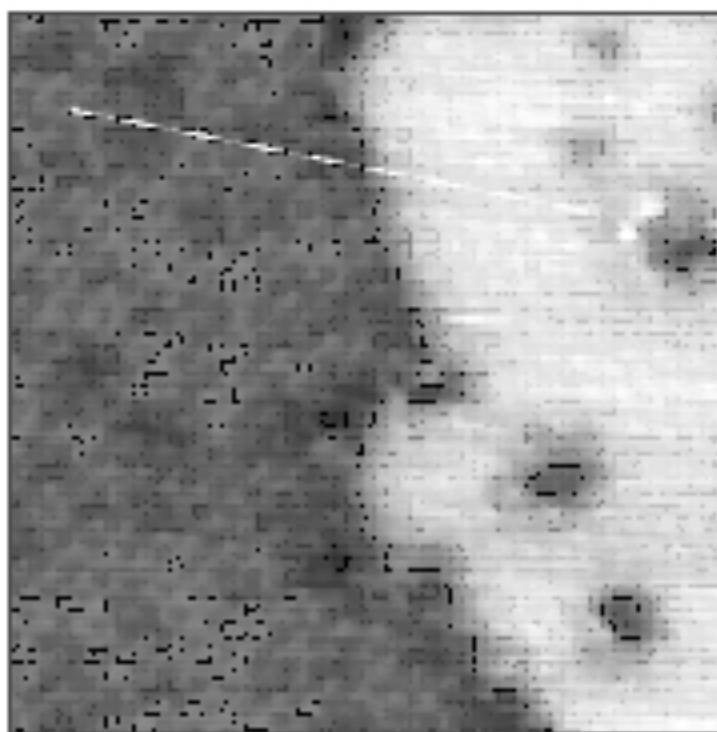

# Partial DOS for O<sub>3</sub>-terminated surface

Gaussian width 0.03 eV, red color for surface;  $\Delta E_{\text{gap}}(\text{bulk})=0.64 \text{ eV}$ ,  $\Delta E_{\text{gap}}(S)=0.23 \text{ eV}$

## **Summary:**

FP-LAPW calculations for  $\text{Fe}_2\text{O}_3$ (0001) surface predict the existence of two domains with (1x1) periodicity:  $\text{Fe}-\text{O}_3-\text{Fe}-\dots$  and  $\text{O}_3-\text{Fe}-\text{Fe}-\dots$ , as well as higher-energy metastable structures.

Lattice relaxations are huge (57 % for the Fe terminated, 79 % for the  $\text{O}_3$  terminated surface).

Both surfaces exhibit surface states of Fe 3d character.

STM experiments at  $\text{Fe}_2\text{O}_3$  films, created under high oxygen pressure conditions, confirm the presence of two domains.
